# User's Manual for the National Water Information System of the U.S. Geological Survey

## Water-Quality System

### Version 5.0

By David H. Dupré, Jonathon C. Scott, Melanie L. Clark, Michael G. Canova, and Yvonne E. Stoker

## 1 INTRODUCTION

This user documentation is designed to be a reference for the quality of water (QW) programs within the National Water Information System (NWIS). If you are a new user, the “Introduction” and “Getting Started” sections may be the right place for you to start. If you are an experienced user, you may want to go straight to the details provided in the “Program” section (section 3). Code lists and some miscellaneous reference materials are provided in the Appendices. The last section, “Tip Sheets,” is a collection of suggestions for accomplishing selected tasks, some of which are basic and some are advanced. These tip sheets are referenced in the main text of the documentation where appropriate.

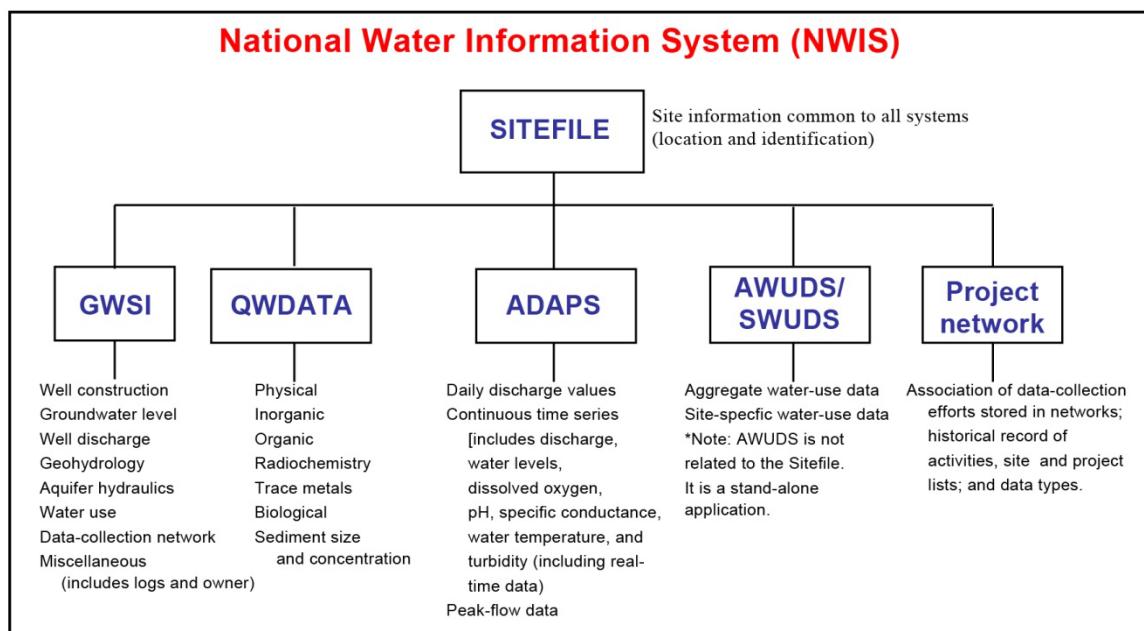

### 1.1 NWIS Description

As part of the U.S. Geological Survey (USGS) program of disseminating water data to the public, the Water Resources Discipline (WRD) maintains a distributed network of computers and fileservers for the storage and retrieval of water data collected through its activities at approximately 1.5 million sites. This system is called the National Water Information System (NWIS).

The NWIS is a distributed database in which data can be processed over a network of workstations and fileservers at USGS offices throughout the United States. The system is composed of four subsystems: the Ground-Water Site-Inventory System (GWSI), the Water-Quality System (QWDATA), the Automated Data Processing System (ADAPS), and the Water-Use Data System, which is composed of the Aggregate Water-Use Data System (AWUDS) and the Site-Specific Water-Use Data System (SWUDS).

- Many types of data are stored in the NWIS distributed and local databases, including:
- site information,
- time-series (flow, stage, precipitation, chemical),
- peak flow,
- groundwater,
- water quality, and
- water use.

The NWIS structure and the types of data available in its subsystems are shown in the figure below.

**NWIS structure and types of stored hydrologic data.**

## 1.2 QWDATA System Description

NWIS provides for the use of one or more logical water-quality databases within one database, all accessed using one copy of the NWIS software. A logical water-quality database consists of a water-quality file (QWFILE), a station file (SITEFILE), and shared reference files. The QWFILE is a keyed-indexed file of database tables managed by a UNIX-based software system. This system allows records to be retrieved efficiently based on the values of selected data defined as KEY elements: agency code, site ID, begin date, begin time, end date, end time, and medium code. The SITEFILE is accessed for selecting water-quality records by SITEFILE data elements, such as site ID, site type, and location. Reference files, such as the parameter code file and the geologic-unit code file, are implemented as database tables and are used for checking the validity of data entry values.

Each water-quality record to be stored is initialized by “logging in” the data, and this is typically done when field data are available. When a sample is logged in, a record number that is unique within each logical water-quality database is automatically assigned to each analysis. The record number may be used later to access the analysis for updating or viewing. Personnel who have access rights for entering data may log in analyses.

## 1.3 User Access and Setup

User access is controlled internally by USGS policies and procedures.

## 1.4 Acknowledgements

Acknowledgement is given to the many people who contributed to the preparation, review, and testing of this documentation. This group includes:

Richard Coupe	Ed Pustay
Jerri Davis	Donna Runkle

Kerry Garcia	Lynn Taylor
Dorrie Gellenbeck	Sonya Vasquez
Barbara Hoopes, Editor	Rick Wagner
Callie Oblinger	

## 2 GETTING STARTED

### 2.1 Terminology

#### 2.1.1 Sample

An environmental sample is the portion of a media such as water, sediment, tissue, etc. collected from a site during a specific date and time or a range of dates for analysis. A sample in the database is uniquely identified by the key variables pertaining to sample collection: agency code, station number, begin date, begin time, end date, end time, and medium code. The results of the chemical analyses and physical determinations for an environmental sample are generally stored as one sample. The key variables are sometimes adjusted to separate samples that are hydrologically related but that cannot be stored as one sample. For example, quality-control (QC) samples are stored as separate samples using one of the designated QC medium codes. Samples from different depths or cross sections may use time to “off-set” samples that were collected at the same site on the same date.

#### 2.1.2 Result

Values derived from chemical analyses or physical determinations of a sample are stored in the database as results. Results are uniquely identified for each sample by a parameter code that defines the property or constituent measured.

#### 2.1.3 Parameter Code

Parameter codes are five-digit codes used to identify the constituent or property measured in a sample and the units of measurement. Some parameter code definitions include information about the methods used to measure the constituent or property, but this level of information is not currently consistent in the naming system.

#### 2.1.4 Record

A record is equivalent in a numbered database to a single, uniquely identified sample.

#### 2.1.5 Record Number

A record number is an eight-digit number that is automatically assigned to a sample when the sample is logged into the database. The number is composed of a three-digit water year that omits the millennium, followed by a 5-digit sequential number; for example, 00200075 is the 75th sample entered in water year 2002. The record number is equivalent to the key variables that uniquely identify a sample and can be used instead of the key variables in most of the NWIS QW programs. These numbers are unique only within a database and must be used cautiously in an NWIS installation of multiple databases. When retrieving data from multiple databases within an NWIS installation, the table-retrieval program will accept a file that consists of rows listing the eight-digit record number followed by a two-digit database number. The two-digit database number will be used only by the table output and retrieval programs in QWDATA.

## 2.1.6 Site

A site is the physical location where a sample is collected or a measurement is made. Information about a site must be stored in the NWIS SITEFILE before any other data can be stored for that site. Equivalent terms: station.

## 2.1.7 Station Number

A station number is typically an 8- to 15-digit number assigned to a sampling site when it is established in the NWIS system (Novak, 1985). The eight-digit numbers are generally downstream order numbers that increase in the downstream direction and are used for surface-water locations on streams or rivers. Additional digits can be added to the eight-digit downstream order station numbers (up to a maximum of 15-digits) to achieve some sequencing. The 15-digit numbers are generally a combination of the latitude, longitude, and sequence number of the location. A sequence number is used to separate locations that are very close to each other. Equivalent terms: site ID or station ID.

## 2.1.8 WATLIST

WATLIST is an output file produced by batch input programs that contain (1) a listing of the records that were updated; (2) a cation-anion balance table, if the balance can be computed; (3) a listing of any generated error messages; and (4) a listing of chemical verification messages.

## 2.1.9 Time Definitions

QWDATA requires the entry of a time datum during login of a sample. To simplify the discussion within this documentation and between sub-systems of NWIS, the following definitions have been established.

**Time zone**—a geographic polygon where time is observed using a particular offset (in hours) from Coordinated Universal Time (UTC).

**Time datum**—a variable that combines the time zone and the daylight-saving time usage associated with a time measurement.

**Watch time**—the time-of-day used by the person making and recording a measurement or setting up an instrument to record measurements. The time-of-day recorded on field notes is converted to and from UTC within the database by using a watch-time datum.

**Site-default time datum**—the time datum normally used by a USGS office when recording time at a data-collection site. The date of the time measurement must be taken into account to determine the site-default time datum, since daylight-saving time is (typically) only in effect during the summer. **Note: the time-zone component of the site-default time datum may, or may not, be the same as the time zone in which the data-collection site is physically located. Similarly, the daylight-saving-time component of the site-default time datum may not agree with the daylight-saving policy of the region surrounding the site.**

**Locally observed time datum**—the time datum that is commonly used by the populace near a data-collection site. (One might conceptualize this as the time datum used in the local television listings.) Conversion of a time measurement (in UTC) by using the locally observed time datum generates a measurement time-of-day that would be readily intelligible to a non-technical reader near the data-collection site.

An example is included to clarify the distinction between the site-default and the locally observed time datums. An office in the Eastern Time zone chooses to operate all gages in standard time year-round, even though the State where the office is located employs daylight-saving time. The site-default time datum in this case is EST, and the locally observed time datum is EDT for summer time dates.

## 2.2 Using the Interactive Programs

All interactive programs can be accessed from the main QWDATA menu. To start QWDATA type “**qwdata**” at the UNIX prompt, and then the main menu will appear. Detailed information about each of the menu options within QWDATA is available in [Section 3](#) of this documentation.

### 2.2.1 Answering Prompts

When YES/NO questions are asked throughout the programs, an answer of “**Y**,” “**y**,” “**YES**,” “**yes**,” “**N**,” “**n**,” “**NO**,” “**no**,” or a blank will be accepted; any other answer should receive an error prompt and a repeat of the question. Similarly, where you may answer a prompt with “**QUIT**,” “**Q**,” “**q**,” or “**quit**” also will be accepted. Several programs request a numeric response to select an Option (1, 2, or 3). When numeric data are requested, it is not necessary to enter final decimal points; however, embedded decimal points must be entered.

### 2.2.2 Cursor Control

Cursor control screen movement allows you to navigate from item to item, screen to screen, and to other parameters in the interactive programs. The valid cursor control characters and options are:

Enter	Action
^D	(Ctrl-D) Skip to next block
#	Delete (clear) value
/	Move back one field
/x	Continue at item number x
/+x	Move forward (x) items, default x is 1
/-x	Move back (x) items, default x is 1
/@	Continue at item with string @ in label
/p	Back up to previous page (screen)
/n	Advance to next page (screen)
/d	Delete current parameter
/a	Insert new parameter
/c	Cancel editing of current record
/q	Skip remaining items

To exit from the QWDATA system and discard the work of the current menu option, you can use Control-C. This will result in a query to be sure that you want to exit the software.

### 2.2.3 Default Values

You can use a carriage return to accept a default answer to a query in the interactive programs. The default answer is identified by “<CR> =” in angle brackets at the end of the query. Default values for data entry are shown in the entry forms and will be used if you do not change them.

### 2.2.4 Mandatory Fields

Information that is required to store or retrieve data from the database is highlighted in the interactive screens.

### 2.2.5 Help with Valid Codes

You may enter a “?” in a field to obtain help on the information expected for that field. Where help is not available, a message stating that help is not available will appear.

### 2.2.6 Boolean Logic

In programs where criteria can be set to select sites, samples, or results, the default logic is for multiple criteria to all be “true” for a site, sample, or result to be selected. In some programs an option is provided for you to specify that if any of the criteria are “true,” then you should select the site, sample, or result. In these programs you select either “**AND**” or “**OR**” as the logic. “**AND**” Boolean logic expects all criteria to be true. “**OR**” Boolean logic expects any criteria to be true. When you enter more than two Boolean conditions, the software combines the third (and subsequent) condition by enclosing the previously entered logical expression within parentheses. For example, “A or B and C” is evaluated to mean “(A or B) and C.”

### 2.2.7 Command Line Processing

You can enter UNIX commands from the NWIS QW menu screen (but not while running menu-option programs). You cannot use the UNIX commands while you are accessing a data entry field in the software. **Note: Some optional settings may not work when used from within QWDATA. An example is the “rm” command. If this command requires a confirmation of the action outside of QWDATA, it will not require one from within QWDATA. Shell redirection and pipe commands do not work with the UNIX commands entered from the QWDATA menu screens.**

## 2.3 Site-Level Information

Site-level information includes data associated with the site being sampled. Most information for a site is stored in the NWIS SITEFILE, which can be accessed from the Ground-Water Site-Inventory (GWSI) System of NWIS. All documentation for GWSI is available at <http://pubs.usgs.gov/of/2005/1251/>.

A site must be established in the SITEFILE before any water-quality information can be added. A site is established by using the GWSI entry programs as discussed in the GWSI user documentation. Review [Section 3.7.2](#) of this user guide for additional details.

Basic site-level information can be retrieved from the SITEFILE through two QWDATA output programs. For example, if parameter codes 81024 (drainage area), 72000 (land surface altitude), or 72008 (well depth) are requested in output and the values are not stored with the water-quality record, the software will retrieve the stored results for these parameter codes from the SITEFILE. This is only possible with the “Water Quality Table by Sample” or “Flat File by Sample” options. Also, some alphabetic parameter codes are available for retrieving site-level information from the SITEFILE through QWDATA. Alphabetic parameter codes are listed in [Appendix A, Table 13](#).

## 2.4 Sample-Level Information

A sample in the database is uniquely identified by the key variables pertaining to sample collection: agency code, site identifier code, begin date, begin time, end date, end time, and medium code. The automatically generated sample information, the mandatory sample information that must be entered, and the optional sample information that may be entered are described below.

### 2.4.1 Record Number (Automatic)

Record Number is an eight-digit number assigned to a sample when it is logged into the database. The number is composed of a three-digit water year followed by a five-digit sequential number; for example, 00200075 is the 75th sample entered in water year 2002. The record number is equivalent to the key variables that uniquely identify a sample and can be used instead of the key variables in most of the NWIS QW programs. These numbers are unique only within a database and must be used cautiously in an NWIS installation of multiple databases.

### 2.4.2 Agency Code (Mandatory, Key Variable)

Agency Code is a five-character code that defines the agency responsible for the data stored for a sample. The default value is USGS\_ (where “\_” is a blank). The other options for agency code are on your local NWIS installation in the file /usr/local/nwis/support/aanwdx.all.agency.

### 2.4.3 Station Number (Mandatory, Key Variable)

Station Number is typically an 8- to 15-digit number assigned to a sampling site when it is established in the NWIS system. The eight-digit numbers are used for surface-water locations on streams or rivers and are generally downstream order numbers that increase in the direction of the drainage basin outlet. The 15-digit numbers are generally a combination of the latitude, longitude, and sequence number of the location. A sequence number is used to separate locations that are very close to each other.

### 2.4.4 Begin Date (Mandatory, Key Variable) and Begin Time (Optional, Key Variable)

Begin Date is the date the sample was collected (or the first date for a sample that is collected over multiple days). The format is YYYYMMDD.

Begin Time is the time the sample was collected (or the first time for a sample that is collected over a date or time range). The format is HHMM. Although this is an optional entry, it is one of the key variables used to identify a sample. If the field is not populated, then a null will be used on retrieval.

### 2.4.5 End Date (Optional, Key Variable) and End Time (Optional, Key Variable)

End Date is the last date of a sample that is collected over multiple days. The format is YYYYMMDD.

The End Time is the last time of a sample that is collected over a date or time range. The format is HHMM.

## 2.4.6 Time Datum

Time Datum ([see Section 2.1.9](#)) is a required code that represents the time zone and daylight-saving time indicators that define the times entered in the begin date and end date fields. This field will be populated with the site-default time datum from the SITEFILE for the sampling site entered, but the field can be changed to any valid time datum. A complete list of valid time datum codes is available in [Appendix J – Table 1](#).

## 2.4.7 Time-Datum Reliability Code

Time-Datum Reliability code is a required code that represents the reliability of the time datum entered for a sample. This field will be populated with “K” (Known), but it can be changed to “E” (Estimated) if desired. Descriptions of valid time-datum reliability codes are available in [Appendix J – Table 2](#).

The time-datum reliability code is used by QWDATA to determine when the time datum appears on some output formats. If the code is set to “K,” the time datum will appear on all output formats. If the code is set to “T” or “E,” the time datum will not appear automatically. Review [Section 3.4.3.4](#) for additional details.

## 2.4.8 Medium Code (Mandatory, Key Variable)

Medium Code is the medium from which the sample was collected (i.e., surface water, groundwater, sediment, tissue, etc.). The medium code is a three-character code that contains a “super” medium, a submedium, and an indicator whether the sample is an environmental or QC sample. A complete list of the valid medium codes is in [Appendix A, Table 1](#).

## 2.4.9 Sample Type (Mandatory)

Sample Type is the type of sample collected (i.e., regular, replicate, blank, or spike). The default value for this code is “9” (Regular). The sample type codes are in [Appendix A, Table 4](#).

## 2.4.10 Analysis Status (Mandatory)

Analysis Status specifies the level of security of the sample (i.e., unrestricted, internal use only, and proprietary). The default value for this code is “U” (Unrestricted) for regular samples and “I” (Internal use only) for quality-control samples. Proprietary samples should be coded with a value of “P” ([Section 2.14](#)). Samples coded with “U” will be released to the public. The analysis status codes are in [Appendix A, Table 5](#).

#### 2.4.11 Hydrologic Condition (Mandatory)

Hydrologic Condition is the hydrologic stage that is represented by the sample collected (some examples are: normal, falling, rising and peak). The default value for this code is determined from the sample medium. The hydrologic condition codes are in [Appendix A, Table 2](#).

#### 2.4.12 Hydrologic Event (Mandatory)

A Hydrologic Event is a natural or human-related occurrence that is represented by the sample collected, for example, storm, drought, snowmelt, or other choices. The default value for this code is determined from the sample medium. The hydrologic event codes are in [Appendix A, Table 3](#).

#### 2.4.13 Geologic Unit Code (Optional)

A Geologic Unit Code is interchangeably referred to as the “aquifer code” and is an eight-character code that designates the aquifer associated with groundwater samples. The codes are defined in the “Catalog of Aquifer Names and Geologic Unit Codes.” Use Option 4 of the Support Files submenu to help find the appropriate code. Entries of geologic unit codes will default to capital letters if lowercase letters are input.

#### 2.4.14 Lab Number (Optional)

Lab Number is the analytical laboratory identification number given to a group of bottles from one field sample that are received together in a shipment.

#### 2.4.15 Project Number (Optional)

Project Number is the nine-character project code associated with the sample.

#### 2.4.16 Organism Code (Mandatory only for plant or animal tissue media)

Organism Code is a numerical code identifying the source organism of a tissue sample. The organism codes that can be used in the NWIS are a subset of the Integrated Taxonomic Information System (ITIS) described at <http://www.itis.gov/>.

#### 2.4.17 Body Part Code (Mandatory only for plant or animal tissue media)

Body-Part Code is a numeric code used to further qualify the tissue analyzed for a tissue sample. The body part codes are in [Appendix A, Table 14](#).

#### 2.4.18 Sample Field Comment (Optional)

Sample Field Comment is a text field to hold information from the field about a sample that cannot be defined by the coded information in the system.

#### 2.4.19 Sample Lab Comment (Optional)

Sample Lab Comment is a text field to hold information from the lab about a sample that cannot be defined by the coded information in the system.

#### 2.4.20 Sample Collecting Agency (Optional)

The sample Collecting Agency is an alphabetic code identifying the agency primarily responsible for collecting the sample. Valid collecting agency codes are in [Appendix K](#), Protocol Organization Codes. A default value for this field can be set in this file on your NWIS system: /usr/local/nwis/data/auxdata/qw.conf. For details about how to use the qw.conf file, see [Section 3.8](#).

#### 2.4.21 Sample Customer Code (Not stored)

Each sample is associated with a “Customer code” (also known as a “user code”), which consists of two or three letters or digits. The customer code is not stored in the database, but it may be used in batch-file versions of sample data to indicate which office should receive the sample and result data after analysis by the laboratory. The list of valid customer codes is maintained by the USGS National Water-Quality Laboratory (NWQL) in Denver, and USGS users on the internal network can retrieve it from the Water-Quality Data Transfer System (QWDX) by selecting the “Retrieve limited QWDX Reports” option, and then selecting on the “QWDX Customers (WSC, etc) Report” option.

## 2.5 Result-Level Information

### 2.5.1 Remark Code

Remark codes provide additional information about the magnitude (or absence) of a value. View the remark code with the value to avoid misinterpreting the value. The remark codes are in [Appendix A, Table 6.](#)

### 2.5.2 Value Qualifier Code

Value qualifier codes provide information about the process used to determine an analytical value and, often, the remark code associated with the value. Up to three value qualifiers can be stored with any single result. The value qualifier codes are in [Appendix A, Table 11.](#)

### 2.5.3 Data Quality Indicator Code

Data quality indicator codes indicate the review status of a result, control the ability of a batch input program to overwrite a value, and affect the inclusion of a result in output. The data quality indicator codes are in [Appendix A, Table 9.](#)

### 2.5.4 Null Value Qualifier Code

Null value qualifier codes identify a failed measurement due to a field, lab, or shipment problem. The null value qualifier codes are in [Appendix A, Table 10.](#)

### 2.5.5 Laboratory Standard Deviation

Laboratory standard deviations are usually determined by the laboratory as an explanation of the uncertainty associated with a result value. The laboratory standard deviation field (LSDEV) provides the ability to round values on output by using this information. For radiochemical data, the LSDEV field is used to store the 1-sigma uncertainty for the value, as described in the [Office of Water Quality Technical Memo 2008.06.](#)

### 2.5.6 Method Code

Method codes composed of five alphanumeric characters identify the analytical method used to determine a value. You can display method codes can by using the Support menu Option 8, Display the Parameter Method Table, which is described in more detail in [Section 3.6.8.](#)

### 2.5.7 Preparatory and Analysis Dates

Preparatory and analysis dates are two fields used to identify the dates (YYYYMMDD) of the preparatory step and analysis at the laboratory.

### 2.5.8 Preparatory and Analysis Set Identifiers

Preparatory and analysis set identifiers are two fields used to store the set identification code (up to 12 characters) of the preparatory set and analysis set at the laboratory.

### 2.5.9 Report Level and Report Level Type Code

The report level is the numeric value associated with the analytical method when the result is determined. The report level type is a code used to identify the type of report level used for the method. The report level type codes are in [Appendix A, Table 12](#).

### 2.5.10 Analyzing Entity

The agency, organization, group, or company that analyzes the result is known as the analyzing entity. An eight-character code is used to identify the entity that analyzed the listed result.

Analyzing entities can be displayed by using the Support menu Option 9, Display Analyzing Entity and Collecting Agency Codes, which is described in more detail in [Section 3.6.9](#).

## 2.6 Parameter Codes

The parameter codes are five-digit codes used to identify the type of result stored. The codes are documented in the “[NWIS Parameter Code Dictionary](#)” (PCD). You can search the PCD or list parameter codes from Options 2 and 3 in the Support Files submenu of the QWDATA menu. Selecting the appropriate parameter code may require some verification with the laboratory. The schedules run by the NWQL will contain the parameter code for the data that will be generated; therefore, it may be useful to check the NWQL catalog of schedules for help identifying the parameter code(s) needed. Only numeric parameter codes can be used to enter results into the NWIS system.

### 2.6.1 Calculated Value Parameter Codes

Results may be determined during output for selected parameters by using algorithms stored in a reference table. The parameter codes for these calculated values are user-specified during retrieval. For the calculation to succeed, the parameter codes needed for calculation must be stored. Most calculated parameter codes available in an analysis can be retrieved using the alpha code – CALCV. Algorithms for the calculated parameter codes can be viewed or output in QWDATA through Option 7 in the [Support Files](#) menu. Any of these parameter codes may also be used to store values in the database, if desired. See [Section 3.6.7](#) for more details.

### 2.6.2 Water Science Center-Specific Parameter Codes

Twenty-six parameter codes (99900–99925) are available in the PCD for use by individual Water Science Centers (WSCs). A WSC-specific code is used to store results for constituents that do not have a valid parameter code. Storing results in QWDATA allows them to be stored, tabled, graphed, or exported for use in statistical programs. The first five codes (99900–99904) have default rounding codes of 2, the second five (99905–99909) have default rounding codes of 3, and the remaining codes (99910–99925) have default rounding codes of 5. For more information about rounding codes, refer to [Sections 2.7.1](#) and [3.6.8](#). If WSC-specific parameter codes are included in a publication-style table, the heading for each parameter contains seven characters per line and seven lines of text. The heading may be modified by using an editor to accurately describe the constituent. Exceptions apply to a table produced as described in [Section 3.4.7](#). An example of a WSC-specific code table output is below.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1997 TO SEPTEMBER 1998			
	9990001	9990201	
SPE-	9990002	9990202	
CIFIC	9990003	9990203	
CON-	TEMPER-	9990004	9990204
DUCT-	ATURE	9990005	9990205
DATE	ANCE	WATER	9990006
(US/CM)	(DEG C)	9990007	9990207
(00095)	(00010)	(99900)	(99902)
SEP			
11...	109	10.5	.01

Because the definitions for these parameter codes are WSC specific and they are not stored in QWDATA, it is recommended that the database manager keep a log of the definitions applied to these codes. New parameter codes can be requested instead of using these codes.

### 2.6.3 Fixed Value Codes

QWDATA contains many parameter codes for which the result is not the outcome of an environmental measurement but rather a qualitative scientific observation or description. These types of parameter codes are referred to as “Fixed Value Codes,” and they have a small number of valid results that are related to a description. For example, parameter code 01035 (the severity of detergent suds) has the following valid results.

0	none
1	mild
2	moderate
3	serious
4	extreme

In other cases the result is not the outcome of an environmental observation, but instead further defines the sample. For example, Parameter code 99111 (quality assurance data type associated with sample) has the following valid results.

1	no associated quality assurance data
10	blank
20	blind sample
30	replicate sample
40	spike sample
100	more than one type of quality assurance sample
110	cross-section information stored
200	other

A complete list of parameter codes that have fixed values and the corresponding valid results is in [Appendix B](#).

## 2.6.4 Alpha Parameter Codes

Alpha parameter codes, which may include both alpha and numeric characters, are used in QWDATA to retrieve sample and result-level descriptions as well as groupings of other codes. The descriptions include information stored with the sample such as date, time, and sample record number. An example of an alpha parameter code that represents a grouping of parameter codes is “ADDPC,” which adds all numeric codes to a retrieval. Another example of an alpha parameter code that represents a grouping of parameter codes is “CALCV,” which adds all calculated parameter codes to a retrieval. A complete list of alpha codes is in Table 13 of [Appendix A](#).

For output in a by-result format, only alpha parameter codes may be used to define the columns in the output. For more information on this type of retrieval refer to [Section 3.4.4](#).

## 2.7 Numeric Information

Values in QWDATA are stored in the database by using double-precision floating-point representation, which yields 15–17 decimal digits of precision. Data stored with the result value allows the software to reproduce the precision of the input data when the double-precision stored value is retrieved as unrounded from QWDATA. The retrieval programs available through the QWDATA menus provide more limited precision. Precision of results produced through QWDATA is limited by the internally defined width of the output field, the rounding method, and rounding criteria selected. Even when unrounded results are requested, precision is limited. In general, no more than 8 digits are provided with the retrieval programs in QWDATA. Results used in calculations, or retrieved through other interfaces (such as SQL or ODBC), will be double precision.

### 2.7.1 Rounding

Water-quality values from NWIS may be output as rounded or unrounded. The unrounded choice will output the values as they were received from the lab and stored in the database. There are two choices for rounding values: (1) allow the software to determine how to round the result by using an existing *laboratory standard deviation* ([Section 2.5.5](#)) stored with the result or the value in the rounding array for the specific parameter and method, or (2) use a rounding code stored with each value. See [Section 3.6.8](#) and [Tip Sheet 5.19](#) for details about rounding codes.

You can select only one of the two rounding options above per retrieval for “[Data Output](#)” Options 3, 4, 5, or 6 (see Section 3.4.7). Option 7 for “Data Output,” however, allows multiple rounding options ([Section 3.4.7](#)).

The first one is called “default rounding” and the second one is called “user-defined rounding.” Some user-defined rounding codes have been set to odd values, sometimes by input from the lab, and they may produce unexpected results. The most conservative and consistent option for rounding values at present is default rounding.

User-defined rounding can be used if a rounding code is stored with the result. If a rounding code is not stored with a result, the software will use the value from the parameter-method reference table. To add a rounding code, you can use “[Modify Samples or Results](#)” from the main QWDATA menu. Rounding codes can be added on a large scale by using batch files.

Uncensored, non-zero concentration values that round to zero are, in general, converted to a null value on output, with the remark set to “M” (constituent identified in sample, but not quantified).

Many uncensored measurements, however, may be reported as zero, and those values will remain zero in the output. An example of an acceptable rounded-to-zero result is water temperature. Censored, non-zero concentration values that round to zero are reported with the same number of significant figures that were originally entered with the value.

A rounding code of zero is not accepted by the system. New interactive entries with rounding codes of zero (usually generated by the software) require you to select a different rounding code

before the value will be stored. New batch entries with rounding codes of zero will replace the zero with the appropriate rounding code for that parameter and method.

Programs within QWDATA present result values using the various rounding options. The table below summarizes the rounding options used by the various QWDATA programs.

QWDATA main menu option (option number)	Submenu option (option number)	Rounding behavior
Login Sample (1)	---	Result.
Modify Samples or Results (2)	Enter Field Results (1)	Result.
	Enter Laboratory Results (2)	Result.
	Edit Sample or Results (3)	Result.
Data Review (3)	List Samples and Results (3)	Unrounded.
	Sample List and/or Cation-Anion Balance (4)	Unrounded.
	Chemical Validation Checks (5)	Unrounded.
Data Output (4)	Water-Quality Table by Sample (Publication Format) (3)	Choice.
	Water-Quality Table by Result (4)	Choice.
	Flat File by Sample (5)	Choice.
	Flat File by Result (6)	Choice.
	Flat File with TAB delimiter (Publication Export) (7)	Multiple choices.
	Make a P-STAT Data Set (8)	Choice.
Applications (5)	Summary statistics table (6)	Choice.
	Detection Limits Table (7)	Choice.
Batch Processing (8)	Enter batch-file data for logged-in samples (qwcardsin) (1)	Unrounded.
	Enter batch-file data for all samples (qwenter) (2)	Unrounded.
	Reload batch-file data, overriding DQI (qwcardsinxqdqi) (3)	Unrounded.
	Enter batch-file data with user-specified behavior (4)	Unrounded.
	Review tab-delimited batch files (5)	Unrounded.
	Edit tab-delimited batch files (6)	Unrounded.
	Produce tab-delimited batch files (7)	Unrounded.

[Rounding behavior: **result**, user-rounding based on rounding code stored with the result; **unrounded**, the value displayed is the stored value in the database; **default**, rounding is based on laboratory standard deviation or on the rounding array stored in the parameter-method table; **choice**, user can choose what type of rounding will be applied.]

## 2.7.2 Scientific Notation

During input, the field for entering values in QWDATA is limited to 8 digits and a decimal place. Scientific notation can be used to store values that will not fit in the field because they are very small or very big numbers. The format for storing scientific notation is the mantissa number, “E,” and the exponential power-of-ten value. For example, .00000000023 would be stored as 2.3E-11, and 48,900,000,000 would be stored as 4.89E10. In some cases, the PCD rounding specifications cannot accommodate very small and very large numbers on output. In those cases, user-defined rounding can be selected for output.

## 2.7.3 Negative Values

Negative values may be stored in QWDATA for selected parameters. The types of parameters that can have negative values generally are field constituents or properties (for example, air temperature, in degrees Celsius, parameter code 00020) and chemical constituents that are isotopes (for example, radium 226 dissolved, in picocuries per liter, parameter code 09503). Some of the WSC-specific codes (99900–99909) also will allow negative values to be stored.

A complete listing of the parameters that allow negative values is in [Appendix H](#).

## 2.7.4 Zero Values

Zero values in the database are processed in different ways. The software accepts zeros during processing for all parameters; however, a zero may or may not be a valid value from a scientific point of view. For example, zero for a temperature is a valid measurement. Laboratory methods for measuring chemical constituents, however, do not actually measure zero, but instead censor values that are less than some laboratory reporting level.

For some chemical constituents, zero may have been incorrectly stored for historical data values. You may censor these zero values on output. If you select “User Specified” for “Censoring of Zero Values” in the tabling options menu, a zero value will be converted to a null value and a remark code of U (material analyzed for, but not detected) will be reported. [Section 3.4.3.4](#) describes the tabling options in further detail. A reference list of parameters that are known to have zeros reported for some historical data is in [Appendix I](#).

In some cases, the rounding specifications for a parameter in the PCD do not go to a decadal unit that is small enough for some result values and may result in the value rounding to zero. This is because laboratory methods are not accurate to that level, even though a laboratory measurement was made and reported. In this case, during output processing a small number would incorrectly round to zero, even though a number may be stored. Values that belong to constituents that have reporting units that are used to quantify the abundance of an analytical constituent within some unit of area, volume, mass, or weight cannot be zero. Where the rounding procedures cause a non-zero value to round to zero, an “M” (presence of material verified, but not quantified) will be displayed on output for parameters with the units contained in the table below. The majority of parameters where a value that is rounded-to-zero is replaced by an “M” are measured with the units shown in the table below.

PG/KG	MG/ML	G/SQ M
PG/ML	MG/L	G/ SQ M
NANOGRAMS/LITER	MG/SQ M	G/KG
NG/G	MG / SQ M	UEQ/L
NG/L	MG/M2	MEQ/100 G
MICROGRAMS/LITER	MG/G	MEQ/L
UG/L	MG/KG	ML/L
UG/G	G/M2	
UG/KG	G/CU CM	
UG/M2	G/CU M	
MILLIGRAMS/LITER	G/SQ METER	

**Reporting units where zero values are unacceptable.**

## 2.8 Text Fields for Comments

Text comments can be included within QW records at the sample level and at the result level. Each of these two levels has two categories of comments, those from the laboratory and those from the field. In general, messages from the laboratory are sent directly from the laboratory and should not be edited or altered, although there are circumstances where this might be necessary. Messages from the field can be used to include information relative to the entire sample or to a specific result that cannot be characterized in another field. The recommended maximum length of these comment fields is 300 characters.

***NOTE: Output from QWDATA in flat files or other tabular form generally is limited to displaying approximately 50 characters of these text fields. If your comment is longer than 50 characters, you will not retrieve the complete comment in output. (The WATLIST and publication-export outputs include the entire text field contents.)***

To retrieve these text fields, the following alpha parameter codes can be used when retrieving records.

Code	Meaning
SCMLB	Sample-level comment from lab
SCMFL	Sample-level comment from field
RCMLB	Result-level comment from lab
RCMFL	Result-level comment from field

## 2.9 Validation

Chemical and data validation checks are performed by the data entry programs and the data review and batch processing programs.

### 2.9.1 Data Entry Validation

Data validation checks are performed in the login samples program (Option 1, described in [Section 3.1](#)), modify sample and results program (Option 2, described in [Section 3.2](#)), and batch processing programs (Option 8, described in [Section 3.8](#)).

Data validations are performed for the following sample header items (items with an “\*” are validated against the NWIS reference lists).

- Station number (exists in the Site file )
- Sample has been logged into the database (date, time, medium code)
- Sample collection start and end date and times (before current time)
- Time datum appropriate for location of sample
- Medium code\*
- Sample type code\*
- Analysis status code\*
- Hydrologic condition code\*
- Hydrologic event code\*
- Geologic unit code\*
- Organism code\*
- Body part code\*
- Sample collection agency code\*

Data validations are performed for the following result items (items with an “\*” are validated against the NWIS reference lists).

- Parameter and method codes\*
- Result value (if fixed-value code\*)
- Rounding (the entry must be in the following set: 1,2,3,4,5,6,7,8,9, ':', ';', '<', '=' , '>', '?' , or '@' )
- Remark code\*
- Data-quality indicator code\*
- Value-qualifier code\*
- Null-value qualifier code\*

- Reporting-level value (must be > 0)
- Reporting-level type code\*
- Analyzing entity code\*
- Preparation and analysis date

## 2.9.2 Chemical Validation

Chemical validation checks are performed in the data review programs (Option 3, described in [Section 3.3](#)) and the batch processing programs (Option 8, described in [Section 3.8](#)) and the results are printed in the WATLIST. The chemical validation checks are available in the sample list and/or cation-anion balance (Option 4, described in [Section 3.3.4](#)), chemical validation checks (Option 5, described in [Section 3.3.5](#)), and create or modify ion balance specification options (Option 6, described in [Section 3.3.6](#)).

A detailed listing of the chemical validation checks in QWDATA is listed in [Appendix M](#). In general these checks include the following items.

- Field measurement results against general guidelines
- Chemical logic
- Bacterial logic
- Comparisons between stored calculated parameters and current calculated values
- Comparisons between related constituents
- Comparisons between unfiltered and filtered constituents
- Comparisons between selected constituents and individual parameters that make up the sum of parts
- Comparisons of constituents to alert limits in [Appendix E](#)
- Comparisons of constituents to custom, user-specified alert limits that are described in more detail in [Section 3.3.5](#).
- Calculation of a standard or customized cation/anion balance
  - The custom balance option is described in more detail in [Section 3.3.6](#).

### 2.9.2.1 User-Specified Alert Limit Forms

The data review and batch-processing programs automatically compare selected constituent values to U.S. Environmental Protection Agency (EPA) Drinking Water Maximum Contaminant Levels and Secondary Maximum Contaminant Levels. Users also may need to compare results to other Federal, State, and local regulatory standards for waters used for specific purposes. User-specified alert limit forms are used by data review and batch-processing programs in QWDATA to provide users with the option to compare results to these other Federal, State, and local regulatory standards.

### 2.9.2.1.1 List of User-Specified Alert Limit Forms Available

You can view a list of available user-specified alert limit forms by going to the following directory: `/usr/local/nwis/data/auxdata/qw_alert_limits`. In this directory are several files with the format `alert.limitnn`. The “nn” represents a two-digit number that identifies the form (e.g., `alert.limit01`). Use any UNIX editor to view the contents of these ASCII files.

### 2.9.2.1.2 Adding a New User-Specified Alert Limit Form

You can add new user-specified alert limit forms for use in QWDATA by creating a form using a specific format and storing it in the `/usr/local/nwis/data/auxdata/qw_alert_limits` directory. Create new user-specified alert limit forms if none of the available forms fit the data to be entered. Review the available user-specified alert limit forms prior to creating a new form to avoid duplicating forms.

To make a new user-specified alert limit form, change directories to `/usr/local/nwis/data/auxdata/qw_alert_limits`. Choose the user-specified alert limit form number to be used for the new form by listing the alert limit forms in the directory. Alert limit form names are in the format `alert.limitnn` where “nn” is the two-digit number that identifies the form. Choose a form number that is not already in use. Use any UNIX editor that produces an ASCII output file to create or edit an alert limit form file. Use the first line of the form to document the purpose of the form by placing a “#” character in the first column. Use additional lines for comments as long as a “#” character is in the first column of the line. Each alert limit line contains (1) parameter code, (2) logical operator for limit, (3) alert limit value, and (4) alert limit name. These values are separated by a <tab> character. An example of a user-specified alert limit form is shown [Appendix G.](#)

## 2.10 Field Forms

Field forms are used by interactive entry of data and edit programs in QWDATA to provide a list of parameters that are routinely collected for a particular project, field trip, WSC water-quality field sheet, or data from a non-USGS laboratory. Field forms are a list of parameter codes and associated information that are accessed by various programs so that a user can enter efficiently field or laboratory data. Each field form is identified by a unique number that is part of the field form name. Entry programs for field and laboratory data are discussed in [Sections 3.2.1 – Enter Field Results](#), [3.2.2 – Enter Laboratory Results](#), and [Tip Sheet 5.2](#).

### 2.10.1 List of Field Forms Available

You can view a list of available field forms either by going to the directory where the forms reside or by listing them within QWDATA. To view the available forms in the directory where they reside, change directories to `/usr/local/nwis/data/auxdata/qw_field_forms/`. In this directory there are several files with the format `field.parmsnn`. The “nn” represents a two-digit number that identifies the form (e.g., `field.parms01`). Use any UNIX editor to view the contents of these ASCII files.

Another way to list the available field forms is within QWDATA during data entry. The prompt shown below appears during data entry after the login of a sample and when [Enter Field Results](#) or [Enter Laboratory Results](#) has been selected.

Enter field form nn, ?nn for detail of form nn, ? for list of forms available:

At this prompt, you can enter a “?” and a list of available field forms will appear that includes the form number followed by either a form title or a list of parameter codes in that field form. To view the details of a specific form, enter a “?nn” at the prompt above, where “nn” is the field form number of interest. A list of parameter codes and associated information will be displayed for that field form.

### 2.10.2 Adding a New Field Form

You can add new field forms can be added to be used in QWDATA by creating a form using a specific format and storing it in the `/usr/local/nwis/data/auxdata/qw_field_forms` directory. Create new field forms if none of the available field forms fit the data to be entered. Review the available field forms prior to creating a new field form to avoid duplicating field forms.

To make a new field form, change directories to `/usr/local/nwis/data/auxdata/qw_field_forms`. Choose the field form number you are going to use for the new form by listing the field forms in the directory. Field form names are in the format `field.parmsnn` where “nn” is the two-digit number that identifies the form. Choose a field form number that is not already used. Use any UNIX editor that produces an ASCII output file to create or edit a field form file. Use the first line of the form to document the purpose, by placing the “#” character in the first column. Use additional lines for comments as long as “#” is in the first column of the line. The format and an example of a field form are shown in [Appendix G](#).

You can enter any numeric parameter into a field form. Alpha parameters (such as GUNIT for geologic unit code) cannot be used in the form. Be sure that the final line of the form ends with a carriage return. If you do not include a carriage return, the last parameter will not be included during data entry. A maximum of 100 parameters can be included in any field form.

As part of creating new field forms, you can create descriptions for the parameter codes listed. Be careful not to create descriptions that could cause confusion when compared to the definitions in the PCD. For example, a parameter described as “chloride, dissolved” in the field form and defined as “chloride, total” in the PCD could cause incorrect data storage and interpretation, as well as significant future confusion. Creating a new field form is discussed in [Tip Sheet 5.3.](#)

## 2.11 Multiple Databases

Users have access to multiple water-quality databases where each database file is associated with a generic filename and a database number. A database number is a two-digit number, ranging from 01 to 99. Regardless of the number databases that are implemented on each system, any user who has not been assigned an alternate database number in the database selection table will be associated with database number 01. Additional information and instructions for implementing and using multiple databases are in the manual for the nwdb command.

### 2.11.1 When to Use an Alternate Database

Within NWIS, users have the option to create and use multiple water-quality databases. The decision to create and maintain an alternate database is one that should be carefully considered to ensure that the needs being met by an alternate database are sufficient to outweigh the problems associated with maintaining two or more databases.

Some of the issues involved with having more than one database are:

- duplicate data stored in multiple databases require that updates be applied to more than one database to maintain data integrity;
- only data from database 01 will be displayed on NWISWeb;
- an alternate database that is created for a specific project might be abandoned if the project chief leaves;
- alternate databases require increased data management responsibilities;
- interactive and batch entry results require setting the proper database number prior to NWIS use; and
- automated loading of NWQL results require setup and use of a separate NWQL user code.

Prior to the release of NWIS 4.1, one of the major reasons for the creation of alternate databases was to prevent the release of data for which there should be no public access; for example, proprietary data (either permanent or temporary), cooperators data, and QA/QC data. With the release of the 4.1 revisions of QWDATA, codes are available for restricting access within the same database; however, sample coding must be rigorously correct if proprietary and publicly-accessible data are stored in the same database. If proprietary data are segregated into an alternate database, these data can be excluded safely and easily from unauthorized users, including NWISWeb.

Other reasons for having an alternate database include testing, training, and organization. For example, much NAWQA data is kept in an alternate database, because NAWQA study units generally are not aligned with WSC boundaries, and the primary responsibility for serving data to the public lies with the WSC that has jurisdictional responsibility for the site where the data were collected.

The NWIS Program office recommends that an alternate QW database be used for storage of QA/QC and proprietary data to protect these data from accidental release to unauthorized sources in response to a public inquiry, or the inadvertent inclusion of the data in a report or on NWISWeb.

WSCs should avoid the situation where multiple copies of the same sample data are stored in separate databases on the same NWIS installation, because keeping the multiple copies consistently up-to-date is difficult.

### 2.11.2 How to Set Up an Alternate Database

If you determine that an alternate database is needed, the directions are located on the NWIS internal website. They are not duplicated here because of changes that might be required as the NWIS software changes.

### 2.11.3 What Software Works with Multiple Databases

Multiple databases can be accessed when retrieving records and when creating output tables. You can access these options through Options [3 – “Data Review”](#) or [4 – “Data Output”](#) from the main QWDATA menu (see [Section 3.3.2](#)).

## 2.12 Quality-Control Samples

The recommended procedures for storing quality-control (QC) samples in NWIS are described in this section. QC data provide information about the bias and variability in the environmental data; therefore, the QC samples need to be identified in a manner that relates them to corresponding environmental samples. In addition, the QC samples need to be stored separately from the environmental samples to prevent any unintentional retrieval of these types of data. The recommended procedures address both of these requirements.

### 2.12.1 Definitions of Quality-Control Samples

Blank samples are taken to ensure that environmental samples have not been contaminated by the data collection process. Any measured value/signal in a blank sample for an analyte (a specific component measured in a chemical analysis) that was absent in the blank solution is believed to be due to contamination. Many types of blank samples are possible, each designed to segregate a different part of the overall data-collection process including sampling, filtering, preserving, storing, transporting, and analyzing.

**Blank solution** — Solution that is free of the analyte(s) of interest. Such a solution would be used to develop specific types of blank samples as described below.

**Shelf (or hold) blank** — A blank solution put in the same type of bottle used for an environmental sample and stored adjacent to an environmental sample in a storage area.

**Refrigerator blank** — A blank solution put in the same type of bottle used for an environmental sample and stored adjacent to an environmental sample in a refrigerated storage area.

**Trip blank** — A blank solution put in the same type of bottle used for an environmental sample and kept with the set of sample bottles both before and after sample collection.

**Sampler blank** — A blank solution poured or pumped through the same field sampler used for the collection of an environmental sample.

**Filter blank** — A blank solution filtered in the same manner and through the same filter apparatus used for an environmental sample.

**Splitter blank** — A blank solution mixed and separated using a field splitter in the same manner and through the same apparatus used for an environmental sample.

**Preservation blank** — A blank solution treated with the same preservatives used for an environmental sample.

**Field blank** — A blank solution subjected to the same aspects of sample collection, field processing, preservation, transportation, and laboratory handling as an environmental sample.

**Equipment blank** — A blank solution processed through all equipment used for collecting and processing an environmental sample (similar to a field blank, but normally done in the more controlled conditions of the office and not transported to the field).

**Ambient blank** — A blank solution put in the same type of bottle used for an environmental sample, kept with the set of sample bottles before sample collection, and opened at the site and exposed to the ambient conditions.

**Source solution blank** — A blank solution sent to a laboratory to confirm that it is free of the analyte of interest.

**Lab blank** — a blank solution prepared in the laboratory and analyzed the same as an environmental sample.

**Blind sample** — A sample submitted for analysis whose composition is known to the submitter but unknown to the analyst. A double-blind sample is one of known composition that is submitted to the analyst in such a manner that neither its composition nor its identification as a check sample is known to the analyst. A blind sample is one way to test the proficiency of a measurement process. Blind samples can be used to monitor the performance of an analytical system, check the analytical results of more than one laboratory, more than one analytical method, or the consistency of the same laboratory and method. Every blind sample analyzed should have an associated reference to the source and the possible dilution. Blind samples may be prepared from a reference material, as defined below.

**Reference material** — A material or substance, one or more properties of which are sufficiently well established, to be used for the assessment of a measurement method or for assigning values to materials.

**Replicate (Duplicate) samples** — a group of samples, collected so that they are intended to be essentially identical in composition. Replicate is the general case, for which duplicates are the special case and consist of two samples. Many types of replicate samples are possible, each of which may yield slightly different results in a dynamic hydrologic setting, such as a flowing stream. The types of replicate samples are:

**Concurrent samples** — samples collected by two or more people collecting samples simultaneously or by one person alternating sub-samples between two or more collection bottles;

**Sequential samples** — a type of replicate sample in which the samples are collected one after the other, typically over a short time; and

**Split samples** — a type of replicate sample in which a sample is split into subsamples contemporaneous in time and space.

**Spike sample** — A sample to which known concentrations of specific analytes have been added in a manner that minimizes the change in the matrix of the original sample. Every spiked sample analyzed should have an associated reference to the spike solution and the volume added.

***Spike solution*** — A solution with one or more well-established analyte concentrations that are added in known quantities to an environmental sample to form a spike sample.

### 2.12.2 Identification of Quality-Control Samples in NWIS

A system for identifying quality-assurance samples and maintaining the relationship with corresponding environmental samples has been established. The MEDIUM CODE, DATE, TIME, and SAMPLE TYPE are used in the following manner to clearly identify all QA data.

#### Blank

- Use the actual STATION NUMBER, DATE, and TIME for blanks associated with a specific site and environmental sample. Use a laboratory STATION NUMBER, DATE, and TIME for blanks that are associated with many sites and/or environmental samples. If more than one blank is analyzed, increment the TIME by 1 minute for each blank.
- Use a MEDIUM CODE of OAQ.
- Use a SAMPLE TYPE of 2.
- You may wish to use HYDROLOGIC EVENT and HYDROLOGIC CONDITION of X.
- Use 991xx parameter codes listed below to designate the type of blank solution, the source of the blank solution, and the type of blank sample. Use 992xx codes listed below to record a solution lot number.
- If more than one blank is collected, use parameter codes 82073 and 82074 to enter the same STARTING TIME and ENDING TIME for each blank. Parameters 99109 and 99110 can be used to enter the SAMPLE SET START DATE and SAMPLE SET END DATE for a blank associated with environmental samples collected on more than 1 day.

#### Blind

- Use the actual STATION NUMBER, DATE, and TIME for blinds associated with a specific site and environmental sample. Use a laboratory STATION NUMBER, DATE, and TIME for blinds associated with many sites and/or environmental samples. If more than one blind is analyzed, increment the TIME by 1 minute for each blind.
- Use a QC MEDIUM CODE.
- Use a SAMPLE TYPE of 4.
- Use 991xx parameter codes listed below to designate the source of the reference material and the source code number.
- If more than one blind is collected or if a blind is related to more than one environmental sample, use parameter codes 82073 and 82074 to enter the same STARTING TIME and ENDING TIME for each blind. Parameters 99109 and 99110 can be used to enter the SAMPLE SET START DATE and SAMPLE SET END DATE for blind samples that are associated with environmental samples collected on more than 1 day.

### **Reference Material**

- Assign a laboratory STATION NUMBER.
- Use the DATE and TIME that material was created or received.
- Select a QC MEDIUM CODE.
- Use a SAMPLE TYPE of 6.
- Use 991xx parameter codes listed below to designate the source of the reference material and the source code number.

### **Replicate**

- Use the actual STATION NUMBER.
- Use the actual DATE and TIME for the first sample, and increment TIME by 1 minute (or actual times if greater than 1 minute) for each additional sample.
- Select an environmental MEDIUM CODE for the first replicate and a QC MEDIUM CODE for the second and subsequent replicates.
- Use a SAMPLE TYPE of 7 for every sample, including the first one. A SAMPLE TYPE of 5 (duplicate) has been used in the past for the special case of replicates consisting of only two samples. The SAMPLE TYPE of 7 should be used for all samples that fit the definition of replicate included in this documentation.
- Use the 991xx parameter code listed below for replicates to designate which of the methods was used to create the replicates.
- Use the same STARTING TIME and ENDING TIME (parameters 82073 and 82074) for all samples.
- If the replicate samples will be stored in the regular database, use normal MEDIUM CODES (i.e., WG or WS) and a sample type of 7.

### **Spike**

- Use the actual STATION NUMBER, DATE, and TIME for spikes associated with a specific site and environmental sample. If more than one spike is analyzed, increment the TIME by 1 minute for each spike.
- Select a QC MEDIUM CODE.
- Use a SAMPLE TYPE of 1.
- Use the 991xx parameter codes listed below to designate the source code number of the spike solution, the spike type, and the volume of the spike. Use an existing code (32000) to designate the sample volume.
- If more than one spike is collected, use parameters 82073 and 82074 to enter the same STARTING TIME and ENDING TIME for each spike. Parameters 99109 and 99110 can be used to enter the SAMPLE SET START DATE and SAMPLE SET END DATE for

blind samples that are associated with environmental samples collected on more than 1 day.

**Spike Solution**

- Assign a laboratory STATION NUMBER.
- Use the DATE and TIME that source was created or received.
- Use a MEDIUM CODE of OAQ.
- Use a SAMPLE TYPE of 8.
- Use the 991xx parameter codes listed below to designate the source of the spike solution and the source code number of the spike solution.

Assign an ANALYSIS STATUS code of “I” (Internal-use only) to each QC sample to prevent the data from being inadvertently released to the public. The following remark codes have been added to the system to allow further identification of some types of QA data:

**A      Average value, and  
S      Most probable value.**

Parameter code 99111, quality-assurance data indicator, can be stored with environmental samples to indicate that there are associated quality-assurance samples. The fixed values for 99111 indicate the type of quality-assurance samples associated with the environmental samples.

Several existing parameter codes in addition to 82073 and 82074 are mentioned in the identification of samples above that would clarify the nature of the sample (both environmental and QA samples). A list is provided below to encourage the use of these parameters. The definitions for the fixed-value parameters are in [Appendix B](#).

- 00115      Sample Treatment**  
**71999      Sample Purpose — fixed value**  
**72005      Sample Source — fixed value**  
**74200      Sample Preservation Method — fixed value**  
**82075      Amount of rinse, in liters**  
**82398      Sampling Method — fixed value**  
**84164      Sampler Type — fixed value**

The parameter codes referenced in the sample identification are defined below.

- 99100      Blank, Type of Solution (fixed value)**  
**99101      Blank, Source of Solution (fixed value)**  
**99102      Blank, Type of Sample (fixed value)**  
**99103      Reference Material, Source (fixed value)**

- 99104 Reference Material or Spike Lot Number**
- 99105 Replicate, Type (fixed value)**
- 99106 Spike, Type (fixed value)**
- 99107 Spike, Source (fixed value)**
- 99108 Spike Volume, in mL**
- 99109 Starting Date for a Set of Samples (YMDD)**
- 99110 Ending Date for a Set of Samples (YMDD)**
- 99111 Quality Assurance Data Type Associated with Sample (fixed value):**
- 1. No Associated QA Data**
  - 10. Blank**
  - 20. Blind Sample**
  - 30. Replicate sample**
  - 40. Spike sample**
  - 100. More than one type of QA sample**
  - 110. Cross-section information stored**
  - 120. Well-purge information stored**
  - 200. Other**
- 99150 Reference material or spike number 2 lot number**
- 99200 Lot number, first, inorganic-grade water, number**
- 99201 Lot number, second, inorganic-grade water, number**
- 99202 Lot number, first, organic-grade water, number**
- 99203 Lot number, second, organic-grade water, number**
- 99204 Lot number, first, VOC-free water, number**
- 99205 Lot number, second, VOC-free water, number**
- 99206 Lot number, Capsule Filter**

## 2.13 Tissue Samples (Will be available soon)

## 2.14 Proprietary Data

Proprietary data consist of information obtained by the USGS for which the Bureau's rights of ownership are restricted in a manner that limits our ability to freely distribute the data.

Proprietary data restrictions may include copyright protection, homeland security issues, or specific agreements with cooperators. Internal-use data include analyses for quality-control samples, and are generally not available to the public. However, the majority of data are without distribution limitations.

Within QWDATA, the analysis status code (ASTAT) can be used to identify the distribution limitations of the sample and all associated results. The data quality indicator code (DQI) can be used to specify review status and control distribution of individual results within a sample. Three optional codes for ASTAT ([Section 2.4.10](#)) can be set by editing the existing record (described in [Section 3.2.3](#)) or setting ASTAT for multiple records at one time (described in [Section 3.7.5](#)). The DQI code is introduced in [Section 2.5.3](#). Proprietary samples should be set with an ASTAT of "P." Proprietary samples will not leave the WSC database.

Details about the data flow related to proprietary data are available at  
<http://water.usgs.gov/admin/memo/QW/qw07.04.html>, and  
<http://water.usgs.gov/admin/memo/QW/qw07.03.html>.

## 2.15 Data Entry Options

Two methods are available for entering data using QWDATA—interactive data entry and batch data entry. Interactive data entry is entering data using queries and entry screens within the software. Batch data entry is using files as input to put data into the database. Both methods can be used to enter or modify data in the water-quality database if you have the required security access. In general, use interactive data entry to enter sample information (record creation), enter field data, and modify existing records for relatively small changes. Batch data entry is generally used for entering or modifying large amounts of data, for example, the input of results from laboratories. You can use either method to remove data from the water-quality database.

### 2.15.1 Interactive Programs

Use Option 1 on the QWDATA main menu to interactively log samples into the database. This option can be used to enter sample information and field data. A [record number \(see Section 2.1.5\)](#) is generated after the sample information has been entered. For specific information about using this program see [Section 3.1, Option 1 – Login Samples](#).

Option 2 on the QWDATA main menu contains options for entering field data and laboratory results and editing samples or results. Option 2.1, “Enter Field Data,” allows you to add field water-quality data to existing records in the QWDATA database. Option 2.2, “Enter Laboratory Results,” allows you to add laboratory data to existing records in the QWDATA database. This option was primarily designed for entering data from non-USGS laboratories; field data also can be entered using this program. Option 2.3, “Edit Samples or Results,” allows you to edit and delete sample and result information for samples that exist in the QWDATA database. For more information on any of these options see [Section 3.2, Option 2 – Modify Samples or Results](#).

Entering field or laboratory results by using any of the above interactive programs is done by using field forms. You can customize these forms to provide parameters of interest for particular data entry needs. More information about field forms is in [Section 2.10](#) and [Tip Sheet 5.3](#).

### 2.15.2 Batch Programs

Option 8 on the QWDATA main menu contains options for entering data by using batch programs. The programs available from this menu work with files of water-quality data and are used for a variety of data needs. The most common application is entering data from laboratories, most typically the USGS National Water Quality Laboratory (NWQL). Other uses of the batch programs and files are outputting entire records or groups of records by specifying the record information and making large scale changes to water-quality data in the QWDATA database.

The batch file format is a tab-delimited format. This tab-delimited format uses a pair of files, one for sample information and one for result information. This format was designed to accommodate new fields introduced in NWIS 4.1 and is expandable for fields introduced in future versions of the software. The file format is discussed in [Section 3.8](#) and example batch files are shown in [Appendix F](#). In previous versions of NWIS (release 4.7 and earlier), a fixed format, known as the “1 and \*(or star)” card format, was also accepted. Specifically, that single-file format was designed for use with NWIS versions prior to version 4.1. Usage of the 1 and \* format was discontinued at NWIS 4.8.

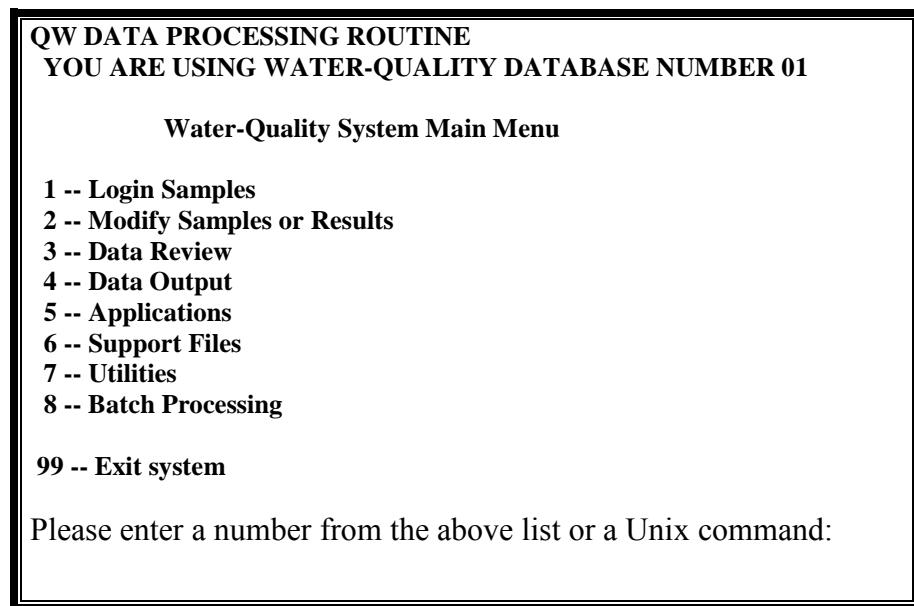

The programs available when using Option 8 can process data into the database for existing and new records, including USGS Laboratory data retrieved from the QWDX, produce batch output in the tab-delimited format, and review or edit a set of tab-delimited batch files. Detailed explanation of these programs is included in [Section 3.8](#).

### 3 PROGRAMS

The data entry, editing, review, retrieval, support, and utility programs in **QWDATA** are initiated by selecting a program through a series of menus. Section 3 of this user documentation describes the various programs available in QWDATA. To display the main **QWDATA** menu, type:

**qwdata**

on the command line, and add a two-digit number if a database other than the default database 01 is desired ( for example, “*qwdata 02*”). In response to the “*qwdata*” command, the menu below will appear and show the version of the software currently installed and the database number used.

**Main QWDATA window.**

This menu displays the eight main options available in QWDATA and lists the various program functions. You can select one of the eight option numbers or type a UNIX command after the prompt at the bottom of the page.

Enter UNIX commands such as “*more*” or “*ls*” to look at filenames or list a file from menu screens. At the conclusion of each program, the main QWDATA menu is redisplayed until you select “**99 – Exit system**” to exit and return to the UNIX prompt. The individual functions and options available in QWDATA are described on the following pages of this section.

### 3.1 Option 1 – Login Samples

The “Login Samples” program can be used to enter sample information and field data. Start it by selecting Option 1 on the main QWDATA menu. A *record number* is generated after you enter the sample information. Multiple samples for a site can be logged in with this program, as well as samples for multiple sites. The login sample form is shown below.

**Note: The site must exist in the NWIS SITEFILE before samples can be logged in or water-quality data can be entered.** The program for adding a new site to the NWIS database is described in the Option 7--Utilities section, [3.7.2 Option 2--Add new site or modify site information](#). Access to this program may be restricted to more experienced database users.

(1) Agency Code: USGS	(2) Station Number:
(3) Begin Date: YYYYMMDD (4) Begin Time: HHMM	
(5) End Date: YYYYMMDD (6) End Time: HHMM	
(7) Time Datum: _____	(8) Time-Datum Reliability: _____
(9) Medium Code: _____	
(10) Sample Type: 9	
(11) Analysis Status: U(12) Hydrologic Condition: _ (13) Hydrologic Event: _	
(14) Geologic Unit Code: * _____	
(17) Lab Number: _____ (16) Project Number: _____	
(17) Organism Code (ITIS): * _____ (18) Body Part Code: * _____	
(19) Sample field comment: N Add?: _	
(20) Sample lab comment: N Add?: _	
(21) Collecting agency: _____	
Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ??/ for help	

**Login sample form. (Shaded text indicates mandatory items. Fields containing an asterisk (\*) are not available for entry unless the appropriate medium code is entered. See additional information for geologic unit, organism, and body part codes.).**

The options at the bottom of the screen allow you to move from item to item, screen to screen, and to other parameters. The valid cursor control characters and options are shown at the bottom of the screen and are described in [Section 2.2.2, Cursor control](#) and [Tip Sheet 5.1](#). The items on the “Login Sample” screen are described below and on [Tip Sheet 5.2](#).

(1) The cursor is initially positioned at the “U” in “USGS.” If this agency code is correct, accept it by entering a carriage return; if not, enter any valid agency code (for example, “USEPA”), followed by a carriage return. A list of valid codes is available in documentation for the [Groundwater Site Inventory System](#).

(2) Next, position the cursor to the first blank following “Station Number:” and the program waits for input. Enter the station number, followed by a carriage return. At this point the program checks to determine if the agency code and station number (also referred to as “station identification,” “site identification,” “or site id”) are in the SITEFILE. If the agency code and station identification are found in the SITEFILE, the station name is displayed and the cursor moves to the next item. If the agency code and station identification are not found in the SITEFILE, an error message is displayed and the cursor returns to the first blank following “Agency Code.”

(3) When a station number has been accepted, the cursor is moved to the first “Y” following “Begin Date.” The begin date is a required item and must be entered in the correct format (YYYYMMDD). The date is checked for validity, including if the date is less than or equal to the current date; future dates are invalid. If the begin date is more than 1 year prior to the current date, a message is displayed and you can reenter the date.

**Note:** For sample composites, the full end date (year, month, and day as YYYYMMDD) must be entered. There are no restrictions on composites that span the end of the month. The only checks made on end date are to ensure that the date is valid and the end date is not earlier than the begin date. (If a composite spans more than 31 days, a warning message is displayed and you can change the end date).

(4–6) The next three items (“Begin Time,” “End Date,” and “End Time”) are optional and may be skipped by entering carriage returns.

(7) The “Time Datum” is a required item and is checked against a list of valid codes. This field will be automatically populated from the SITEFILE settings for the site entered. Type a “?” to display a list of valid time data on the screen. Additional information for the time datum is available in [Sections 2.1.9 and 2.4.6](#), and a list of valid time datum codes is available in [Appendix J, Table 1](#).

If a time datum that does not match the SITEFILE setting for the site is entered, the following warning will appear at the bottom of the screen.

**Warning! Time zone does not match site file settings. Re-enter (Y/N)?**

This is only a warning, because the time datum entered is unexpected, and you are given the chance to change it. There may be a valid reason for the time datum to be different, and the software will store the time datum entered.

When a daylight saving time datum for a sample date that is not during the daylight saving time period is entered, the following warning will appear at the bottom of the screen.

**Warning! Daylight saving time not normally used on this date. Re-enter (Y/N)?**

This is an unusual circumstance and most likely is a mistake; therefore, you are given an opportunity to change the daylight saving time datum.

For composite samples that contain a time period that straddles the daylight saving time date change, the standard time datum is recommended. For example, if the begin date is April 1, 2002, and the end date is April 30, 2002, the standard time datum should be used.

Eastern Standard Time (EST) should be used in the Eastern Time zone. If a daylight saving time datum is used, the following warning will appear at the bottom of the screen.

**Use standard time datum if Start/End date is standard time. Re-enter (Y/N)?**

This gives you the opportunity to change the value entered.

(8) The “Time-Datum Reliability” code is a required item and is checked against a list of valid codes. This field will be automatically populated as “K” (known). You can change the value to any valid code. If the code entered is other than “K,” the time datum stored with the sample will not appear in all output formats. You can display a list of valid reliability codes on the screen by typing a “?”. Additional information for this field is available in [Section 2.4.7](#), and a list of valid time datum codes is available in [Appendix J, Table 2](#).

(9) The Medium Code is a required item and is checked against a list of valid medium codes. Type a “?” to display a list of medium codes on the screen. The cursor is repositioned in the space following the medium code after the list is displayed. Medium codes are described in [Section 2.4.8](#) and a list is available in [Appendix A, Table 1](#).

(10–13) Default values are included in the Sample Type and Analysis Status fields after the medium code is entered. The default values are listed in [Appendix A, Table 1](#). You can replace the default values by entering the desired value. Entering a “?” for any of the items displays a list of valid codes on the screen. Valid codes for sample type, analysis status, hydrologic condition, and hydrologic event are available in [Appendix A, Tables 2, 3, 4, and 5](#).

(14) If the medium code is anything other than WG--Groundwater or WGQ--QA sample - Groundwater, the Geologic Unit Code item is skipped. Display a valid list of geologic unit codes by typing a “?” and at least two characters of the geologic unit code or name. You can view valid codes by using the check support files, Option 6, described in [Section 3.6.4](#). A complete list of valid geologic unit codes is in the file /usr/local/nwis/support/aageol.states.all.

(15) The Lab Number item refers to the lab identification number, which is established when the sample is received at the USGS National Water Quality Laboratory. Normally, you would not know the lab number when you login the sample, and leave this item blank by entering a carriage return. If you enter a value is during initial login, then that value will not be updated by subsequent lab-data input programs.

(16) The Project Number allows you to enter a project identifier.

(17) Samples with the medium codes **BA**--animal tissue, **BP**--plant tissue, **BAQ**--quality assurance sample-animal tissue, or **BPQ**--quality assurance sample-plant tissue automatically convert Organism Code to a required item. To search for valid organism codes, type a “?” and at least two characters that appear in the organism name, followed by a carriage return. To improve the results of the search, enter as many characters as are known; shorter entries could result in a long list of results. The organism codes can also be found in the Integrated Taxonomic Information System at <http://www.itis.gov/>.

(18) Login of samples with medium codes of **BA**, **BP**, **BAQ**, or **BPQ** automatically converts Body Part Code to a required item. Display *valid* body part codes by typing a “?” followed by a carriage return; see [Appendix A, Table 14](#).

(19–20) If a sample comment (either Field or Lab) item has not been entered, an “N” appears between the “:” and the “**Add?**” query. If you enter a “Y” and a carriage return after the “**Add?**” query, a separate editor will appear where you can enter the sample comment. The editor will be sized to the width of the screen. A carriage return will not result in a new line in the editor. A count of the characters available in the field is displayed in the upper right corner. The position of the cursor is displayed in the lower right corner. After entering the sample comment, type “**CTRL-e**” to save and exit the editor. If a sample comment item has already been entered, a “Y” appears after the “:” and the “**Add?**” query will appear as “**Edit?**”. If you choose to edit the existing comment by putting a “Y” after the “**Edit?**” query, then the comment is displayed in a separate editor and options are presented for edit, delete, retain, or cancel. **Note: You may not enter comments directly in the login screen. If you enter anything other than a “Y” or “y” after the “Add?” or “Edit?” queries, the entry will not be accepted, and no change will be made to the comment field.**

(21) The Collecting Agency is a field used to identify the code for the agency that collected the sample. You can display valid collecting agency codes by typing a “?” followed by a carriage return. **Note: the result will be a long list of collecting agency codes and agency names, listed alphabetically by the code. To reduce the list, you can type in a question mark “?” followed by a partial name or a complete name, and all matches based on the short collecting agency code or agency name would be shown on the screen.** For example, if you type “?WRD” then any collecting agency with the word “WRD” in the collecting agency code or name would appear in the list shown on the screen. For this example, this entry would appear, “USGS-WRD – U.S. Geological Survey, Water Resources Discipline

A default value for the collection agency field can be set in the /usr/local/nwis/data/auxdata/qw.conf file. For details about how to use the qw.conf file, see [Section 3.8](#). Valid collecting agency codes are in [Appendix K](#), “Protocol Organization Codes.” Some protocol organization codes cannot be used for new data entry; the program will notify you if the selected code is not valid for new data entry and a different code is needed.

After completing entry of the collecting agency code, you are prompted with an option to make changes to any of the previously entered items on the login sample screen. If any of the valid item numbers are entered, the cursor is repositioned at the selected item. Changes made to any entry are subject to the same edit criteria as during initial entry. A carriage return after the last item or a “/q” allows you to complete the login sample form.

Following completion of the sample-header information, the database is searched to ensure that the header information is new. The header information is a combination of the agency code, station number, medium code, dates, and times. If a record with the same header information is found, the entry is rejected with the following error message.

- That RECORD already EXISTS – RECORD NUMBER #####
- Re-enter(Y/N)?

On completion of the login form, the next screen asks:

- Do you want to enter any data for this record (Y/N)?

If you respond with an “N” this step is skipped. If you respond with a “Y,” the following query appears.

- Are you entering lab (L) or field (F) data? (L or F, <CR>=F):

If you choose “F” the field data entry screen is the same as described in [Section 3.2.1](#).

If you choose “L” the laboratory data entry screen is the same as described in [Section 3.2.2](#).

After entering or not entering data, a record is created and the assigned *record number* is displayed. Many users write the record number on the National Water Quality Laboratory Analytical Services Request Form or water-quality field notes.

<p>Saving record --</p> <p><b>STATION NAME: SWIFTCURRENT CREEK AT SHERBURNE, MONT.</b></p> <p><b>AGENCY CODE: USGS SITE NUMBER: 05016000</b></p> <p><b>BEGIN DATE: 20010101 BEGIN TIME: 2001</b></p> <p><b>END DATE: 20010301 END TIME: 2003</b></p> <p><b>MEDIUM CODE: SB</b></p> <p><b>RECORD entered - record number = 00100010</b></p> <p>Login another record (Y/N)?</p>
---

**Screen displaying the creation of a record number for the sample.**

Next, you will be asked if you wish to:

Login another record (Y/N)?

An “N” ends the program, whereas a “Y” produces the prompt:

Do you wish to edit the same header (Y/N)?

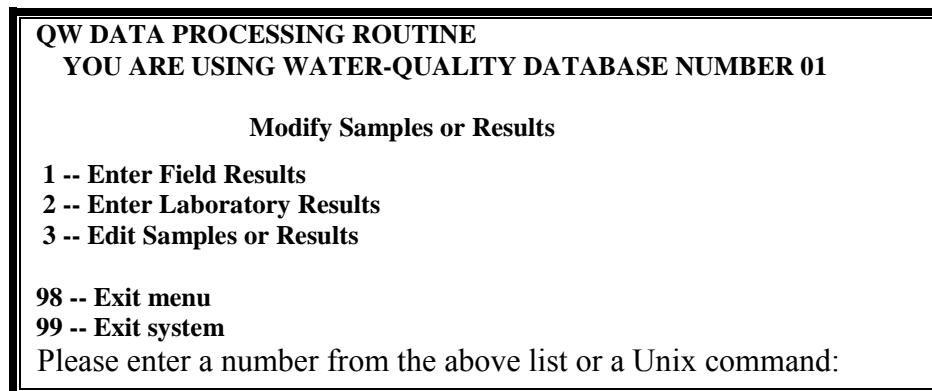

and allows you to edit the header information. If you chose to edit the record header of the previous sample and entered a comment for the sample, then you are given an opportunity to retain or edit the sample comment on the next screen, where the previous sample information is redisplayed with prompts for the item numbers you wish to change.

The ability to edit the previous sample information allows for the rapid login (data entry) of samples with mostly repetitious information (e.g., samples at the same site that differ only by time, such as vertical measurements in a lake). An “N” causes a new input form to be displayed (without the previously entered values). The dialog proceeds as before, with the cursor positioned at the “U” in “USGS” of the agency code. A maximum of 500 parameters can be stored in a single QWDATA file record.

## 3.2 Option 2 – Modify Samples or Results

Option 2 of the main QWDATA menu has three options that can be used to modify samples or results through the submenus. The first option, “Enter Field Results,” is a program used to add field water-quality data to existing records in the QWDATA database. The second option, “Enter Laboratory Results,” can be used to add laboratory data to QWDATA. The third option, “Edit Samples or Results,” can be used to edit existing header information or results.

***Note: A record must exist in the database before any of these programs can be used. The record number or agency, site number, date, time, and medium code must be known before any of these programs can be used. The program for logging in a sample is described in Section 3.1.***

### Modify Samples or Results submenu options.

#### 3.2.1 Option 1 -- Enter Field Results

Field data results can be entered into QWDATA with this program as well as in the “Login Sample” program described in [Section 3.1](#), and the “Enter Laboratory Results” program described in [Section 3.2.2](#).

The “Enter Field Results” program uses a field form, which is a list of parameter codes and associated information in a file named **field.parmsnn**, stored in the directory **/usr/opt/nwis/data/auxdata/qw\_field\_forms**, where “nn” represents the two-digit form number (e.g., field.parms01). Examples of the format needed for a field form are shown in [Appendix G](#).

Additional information about field forms is available in [Section 2.10](#) and [Tip Sheet 5.3](#).

After selecting Option 1, you are prompted to enter the record number for the sample or a carriage return to identify a sample by agency code, station number, start date, start time, end date, end time, and medium code. The record number and sample information are displayed and you are asked if this is the desired record.

```
qwfield -- Water Quality Field Data Entry Program  
Processing in database: 01  
Record Number: 99501617  
Station Name: ST. MARY RIVER NEAR ST. MARY, MT  
Agency Code: USGS Site Number: 05013600  
Begin Date: 19950802 Begin Time: 1300  
End Date: End Time:  
Medium Code: WS  
Is this the desired record (Y/N,<CR>=Y)?
```

**Screen displaying the sample information and  
asking if this is the desired record.**

If you do not want this record, or the record is not found in the database, the you are given another opportunity to enter a record number or agency code, station number, dates, times, and medium code. To quit from this application, enter a “Q” in place of the record number. After the desired sample is displayed and you accept it by typing a “Y” or a carriage return, you are prompted to enter a field form number.

List available field forms to the screen by typing a “?” and a carriage return. You can display detailed contents of the field form by entering “?#” where “#” is the number of the field form. After the number of the desired field form has been identified and entered, followed by a carriage return, the program displays the parameter codes and names from the requested field form, with spaces for entering values and attributes. The cursor is positioned in the method “Meth” field of the first parameter.

(1) 00010 Temperature, water

Options: ? ^D # / /x /+x /-x /@ /n /d /a /c /q -- Enter ?/ for help

**Example of the field-results data entry format (shaded values are mandatory).**

The program begins at the first parameter with the cursor at the method “**Meth**” field. The options for moving around the screen from parameter to parameter and screen to screen are displayed at the bottom of the screen. They are also described in [Section 2.2.2](#) and can be listed on the screen by typing the options “?”. A description of each item in the field-data entry form follows.

**Meth:** The method code is not a mandatory field for the result value, but the method code is validated when entered or edited. General information on the method code is in [Section 2.5.6](#), and you can list method codes for a parameter on the screen by typing a “?” in the “**Meth**” field. Some method codes are not valid for new data entry, and a warning message will be displayed onscreen if one is chosen.

In QWDATA 4.6, analysis method codes were expanded from a one-character to a five-character alphanumeric code. Method codes can be displayed using the Support Files menu Option 8-- Display the Parameter Method Table, (see [Section 3.6.8](#)). If the method code is changed for a result, the following message will appear on the screen.

You have changed the method code for an existing record.

Your options are:

- 1: Replace result\_rd with selection from PMT
- 2: Enter a new rounding code
- 3: Keep the existing result\_rd

Enter 1, 2, or 3 (<CR>=1):

This message is related to the link between the method code and the rounding behavior for that result. **Option 1** (default) will change the rounding code for that result to the value derived from the parameter-method table. **Option 2** allows you to enter any rounding code for that result. **Option 3** will result in the rounding code remaining the same as it was prior to changing the method code.

**V:** The value for the individual parameter. A decimal point at the end of the value is assumed for values entered without a decimal point. You must enter the decimal point for values that are not whole numbers. A carriage return with no data is interpreted as no data, and that parameter is not stored. Entering a “#” signifies a null value, and you are required to qualify the null value with a null-value remark code or null-value qualifier code. If a value exists for a parameter in the field form, entering a carriage return retains the existing value, entering a new value replaces the existing value, and entering “/d” causes the parameter to be deleted from the record. The “V” field can accommodate scientific notation.

**Rd:** The rounding precision is used to display the data. Rounding is described in [Section 2.7.1](#).

*Note: Due to a nine-character field width restriction, the program is unable to display values with nine or more digits.*

**Rmk:** Remark codes are used to qualify data values, as well as null values. Remark codes are listed in [Appendix A, Table 6](#), described in [Section 2.5.1](#), and can be listed on the screen by typing a “?” after the “Rmk” prompt.

**DQI:** The data quality indicator code is a mandatory entry for the result that indicates the review status of the result, controls whether the batch-update programs can overwrite the result, and affects whether the result will be included in retrievals. Valid DQI codes and meanings are listed in [Appendix A, Table 9](#), described in [Section 2.5.3](#), and can be listed on the screen by typing a “?” after the DQI prompt.

**Null Qual:** If the parameter value is entered as a null value, a null-value remark or a null-value qualifier is required. The valid null-value remarks and null-value qualifier codes are listed in [Appendix A, Table 10](#) and described in [Section 2.5.4](#).

**Val Qual Codes:** The value qualifiers provide additional information about the result values, which may be used for interpretation and archival of the results. QWDATA can store as many as three value qualifiers for each result from the valid codes listed in [Appendix A, Table 11](#), described in [Section 2.5.2](#), and can be listed on the screen by typing a “?” after the Val Qual Codes prompt.

**Anl Ent:** The analyzing entity is an optional field that identifies the agency, organization, group or company that analyzes the result, which can be added, changed, or deleted. You can display all analyzing entity codes by typing a “?,” followed by a carriage return. **Note: the result will be a long list of analyzing entity codes and names, listed alphabetically by the code.** To reduce the list, type in a question mark and a partial name or a complete name as input, and all matches based on the short analyzing entity code or name will be shown on the screen. For example, if you type “?NWQL,” then any analyzing entity with the word “NWQL” in analyzing entity code or name would appear in the list shown on the screen. For this example, this entry would appear “USGSNWQL – U.S. Geological Survey, National Water-Quality Laboratory, Denver, Colorado.” All analyzing entity codes can be found in [Appendix K](#), “Protocol Organization Codes,” and they are described in [Section 2.5.10](#). Some protocol organization codes cannot be used for new data entry; the program will notify the user if the selected code is not valid for new data entry and a different code is needed.

**Result field comment:** Result comments are used to describe any information that the user might want to associate with the result value. For example, if the pH meter could not be calibrated with buffer solutions and the pH value was suspect, that information could be stored with the pH value and other parameters, such as alkalinity and bicarbonate, which were measured using the same pH meter. A description of comment fields is included in [Section 2.8](#).

If you have not entered a result comment, an “N” appears after the “Add?” field. If you enter a “Y” and a carriage return, a separate editor will appear. The editor will be sized according to the width of the screen. A carriage return will not result in a new line in the editor. A count of the characters available in the field is displayed in the upper right corner. The position of the cursor is displayed in the lower right corner. Control “c” cancels the comment entry and control “e” saves the comment and exits. You then receive the following prompt.

Do you want to apply the comment to other parameters (Y/N)?

If there is an existing comment, this result field comment will be appended to it.

If you answer “Y,” a new screen is displayed with four options.

1. Enter additional parameter codes at the terminal, where you enter the parameter codes one at a time and use a carriage return to end the program. This brings you back to the field data entry form. The comment can be applied to as many as 500 parameter codes.

2. Apply the comment to parameters contained in a file; enter the pathname of the file at the prompt.
3. Update all parameters in a sample with the comment.
4. Update all the parameters in the sample but confirm each before updating.

If a result field comment exists, then a new screen with three options is displayed for editing an existing comment.

1. Edit the comment,
2. Delete the comment.
3. Cancel the editing process.

If the comment is edited, the four options (listed above) to apply it to other parameters are made available.

When data entry is complete, you can exit the program by either using “/q” or inserting a carriage return after the last parameter in the form. The program provides an opportunity to modify the data by displaying the prompt:

Changes? Enter item number to change or <CR> to continue.

You can add additional parameters may to the sample without having to add them to the **field.parmsnn** file by entering “/a” at any time. A screen prompt will ask for numeric entry of the desired five-digit parameter code, which will be checked against the parameter entry flag in the Parameter Method Table ([Section 3.6.8](#)) to determine if the parameter is valid for entry. Some parameters are no longer valid for new data. If it is valid, the parameter appears at the next line, and the cursor is positioned to accept a value.

As you enter each value, the following checks are made.

1. If the value is negative, the parameter code is checked against a list of codes for which negative values are permitted.
2. If the entry is invalid, a message is displayed and the value is rejected. Negative Values are described in Section 2.7.3 and listed in Appendix H.
3. If the value is for a parameter that should contain fixed values, the fixed values file list is checked; if the value is invalid for that parameter, a message is displayed and the value is rejected. Fixed values are listed in Appendix B and described in Section 2.6.3.
4. If the value for pH (parameter code 00400) is greater than 14, a message is displayed and the value is rejected. If the value for pH is outside the range of 4.5 to 9.0, a message will be displayed during data entry, but the value will be retained.

When data entry is complete, the record is stored and the dialog restarted with the request for a record number or “Q” to end. You will need to run the Chemical Validation Checks program described in [Section 3.3.5](#) to validate updates. General information about chemical validation checks is described in [Section 2.9.2](#).

### 3.2.2 Option 2 – Enter Laboratory Results

The “Enter Laboratory Results” program is used to interactively enter and edit data from cooperator laboratories or USGS laboratory data that are not loaded into QWDATA from other programs. (The batch loading program for QWDATA is described in [Section 3.8](#)). Laboratory data values can be entered into QWDATA with this program as well as in the “Login Sample” program described in [Section 3.1](#), and the “Enter Field Results” program described in [Section 3.2.1](#).

The “Enter Laboratory Results” program uses a field form, which is a list of parameter codes and associated information in a file named *field.parmsnn* , stored in the directory */usr/local/nwis/data/auxdata/qw\_field\_forms/* , where “nn” represents the two-digit form number. Information about adding and designing a field form is available in [Section 2.10](#) and [Tip Sheet 5.3](#).

After selecting Option 2, you are prompted to enter the record number for the sample or a carriage return to identify a sample by agency code, station number, start date, start time, end date, end time, and medium code. The record number and sample information are displayed and you are asked if this is the desired record.

If this is not the desired record, or the record is not found in the database, you are given another opportunity to enter a record number or agency code, station number, dates, times, and medium code. To quit from this application, enter a “Q” in place of the record number. After the desired sample is displayed and accepted by typing a “Y” or a carriage return, you are prompted to enter a field form number.

List available field forms to the screen by typing a “?” and carriage return. You can display detailed contents of the field form by entering “?#”, where “#” is the number of the field form. After the number of the desired field form has been identified and entered, followed by a carriage return, the program displays the parameter codes and names from the requested field form, with spaces for the entry of values and attributes. If the sample already contains data for any of the specified parameters, the stored values are displayed as shown below.

Options: ? ^D # / /x /+x /-x /@ /n /d /a /c /q -- Enter ?/ for help

**Screen showing an example of the laboratory results data entry format  
(shaded values are mandatory).**

The program begins at the first parameter with the cursor at the method “Meth” field. The options for moving around the screen from parameter to parameter and screen to screen are displayed at the bottom of the screen. They are also described in [Section 2.2.2](#) and can be listed on the screen by typing a “?”. Display a list of acceptable codes for some fields on the screen by typing a “?” in the field. A description of each item in the field-data entry form follows.

**Meth:** The method code is not a mandatory field for the result value, but the method code is validated when entered or edited. General information on the method code is in [Section 2.5.6](#), and you can list valid method codes for a parameter on the screen by typing a “?” in the “Meth” field. Some method codes are not valid for new data entry, and a warning message will be displayed onscreen if one is chosen.

In QWDATA version 4.6, analysis method codes were expanded from a one-character to a five-character alphanumeric code. Display method codes by using the Support Files menu Option 8--Display the Parameter Method Table (see [Section 3.6.8](#)). If the method code is changed for a result, the message on the following page will appear on the screen.

This message is related to the link between the method code and the rounding behavior for that result. **Option 1** (default) will change the rounding code for that result to the value derived from the parameter-method table. **Option 2** allows you to enter any rounding code for that result. **Option 3** will result in the rounding code remaining the same as it was prior to changing the method code.

**V:** The value for the individual parameter. A decimal point at the end of the value is assumed for values entered without a decimal point. You must enter the decimal point for values that are not whole numbers. A carriage return with no data is interpreted as no data, and that parameter is not stored. Entering a “#” signifies a null value, and you are required to qualify the null value with a null-value remark code or null-value qualifier code. If a value exists for a parameter in the field form, entering a carriage return retains the existing value, entering a new value replaces the existing value, and entering “/d” causes the parameter to be deleted from the record. The “V” field can accommodate scientific notation.

**Rd:** The rounding precision that is used to display the data. Rounding is described in [Section 2.7.1](#).

**Lab Std Dev:** The laboratory standard deviation will be used to round the result value if default rounding is selected and a value for laboratory standard deviation is present. The laboratory standard deviation is discussed in [Section 2.5.5](#).

**Rmk:** Remark codes are used to qualify data values, as well as null values. Remark codes are listed in [Appendix A, Table 6](#) and described in [Section 2.5.1](#).

**DQI:** The data quality indicator code is a mandatory entry for the result that indicates the review status of the result, controls whether the batch-update programs can overwrite the result, and affects whether the result will be included in retrievals. Valid DQI codes and definitions are listed in [Appendix A, Table 9](#) and described in [Section 2.5.3](#).

**Null Qual:** If the parameter value is entered as a null value, a null-value remark or a null-value qualifier is required. The valid null-value qualifier codes are listed in [Appendix A, Table 10](#), and described in [Section 2.5.4](#).

**Val Qual Codes:** The value qualifiers provide additional information about result values, which may be used for interpretation and archival of results. QWDATA can store as many as three value qualifiers for each result from the valid codes listed in [Appendix A, Table 11](#) and described in [Section 2.5.2](#).

**Rpt Lev:** The reporting level value field contains the reporting level in use for censoring values for the laboratory, constituent, method, and instrument at the time of analysis. Laboratory information is described in [Section 2.5.10](#).

**Rpt Lev Cd:** The report level code describes the type of analytical reporting level in use for censoring data values by the laboratory at the time of analysis. Valid report level codes are listed in [Appendix A, Table 12](#). Laboratory information is described in [Section 2.5.10](#).

**Prep Set No:** The preparatory set number is a laboratory identifier used for a group of field-submitted samples and laboratory-supplied quality control blank and spike samples. These samples are prepared for analytical processing at the same time and by using the same method and reagents. Laboratory information is described in [Section 2.5.9](#).

**Anl Set No:** The analytical set number is a laboratory identifier used for a group of field and laboratory samples, analyzed together by the same analyst, using the same equipment, at the same time. Laboratory information is described in [Section 2.5.9](#).

**Prep Dt:** The preparation date is supplied by the laboratory and represents the date that sample extraction or preparation began. The format for entering this date is YYYYMMDD.

**Anl Dt:** The analysis date is supplied by the laboratory and represents the date that analysis began. The format for entering this date is YYYYMMDD.

**Anl Ent:** The analyzing entity is an optional field that identifies the agency, organization, group, or company that analyzes the result, which can be added, changed, or deleted. All analyzing entity codes can be displayed by typing a “?” followed by a carriage return. **Note: the result will be a long list of analyzing entity codes and names, listed alphabetically by the code.** To reduce the list, type in a question mark and partial name or complete name as input, and then all matches based on the short analyzing entity code or name will be shown on the screen. For

example, if you type “?NWQL,” then any analyzing entity with the word “NWQL” in the analyzing entity code or name would appear in the list shown on the screen. For this example, the entry would appear, “USGSNWQL – U.S. Geological Survey, National Water-Quality Laboratory, Denver, Colorado.” All analyzing entity codes can be found in [Appendix K](#), “Protocol Organization Codes” and are described in [Section 2.5.10](#). Some protocol organization codes cannot be used for new data entry; the program will notify you if the selected code is not valid for new data entry and a different code is needed.

**Result field comment:** Result field comments are used to describe any field information that you might want to associate with the result value. For example, if the pH meter could not be calibrated with buffer solutions and the pH value was suspect, that information could be stored with the pH value and other parameters, such as alkalinity and bicarbonate, which were measured using the same pH meter. Description of comment fields is in [Section 2.8](#).

If you have not entered a result comment, an “N” appears after the “Add?” field. If you enter a “Y” and a carriage return, a separate editor will appear. The editor will be sized to the width of the screen. A carriage return will not result in a new line in the editor. A count of the characters available in the field is displayed in the upper right corner. The position of the cursor is displayed in the lower right corner. Control “C” cancels the comment entry and control “E” saves the comment, exits, and then prompts:

Do you want to apply the comment to other parameters (Y/N)?

If you answer “Y,” a new screen is displayed with four options.

1. Enter additional parameter codes at the terminal, and type in the parameter codes one at a time. A carriage return ends the program, bringing you back to the field data entry form. You can apply the comment to as many as 500 parameter codes.
2. Apply the comment to parameters contained in a file; the pathname of the file is entered at the prompt.
3. Update all parameters in a sample with the comment.
4. Update all the parameters in the sample, but confirm each before updating.

If a result filed comment exists, then a new screen with three options is displayed for editing an existing comment.

1. Edit the comment.
2. Delete the comment.
3. Cancel the editing process.

**Result lab comment:** Result lab comments are used to describe any laboratory information that might be associated with the value. The prompts and screens are the same as the “Results field comment,” which is described above. Text fields for comments are described in [Section 2.8](#).

When data entry is completed, you can exit the program by either using “/q” or inserting a carriage return after the last parameter in the form. The program provides an opportunity to modify the data by displaying the prompt:

Changes? Enter item number to change or <CR> to continue:

You can add additional parameters to the sample without having to add them to the **field.parmsnn** file by entering “/a” at any time. A screen-prompt will ask for numeric entry of the desired five-digit parameter code, which will be checked against the parameter entry flag in the Parameter Method Table ([Section 3.6.8](#)) to determine if the parameter is valid for entry. Some parameters are no longer valid for new data. If it is valid, the parameter appears at the next line, and the cursor is positioned to accept a value.

As each value is entered, the following checks are made:

1. If the value is negative, the parameter code is checked against a list of codes for which negative values are permitted; if the entry is invalid, a message is displayed and the value is rejected. Negative Values are described in [Section 2.7.3](#) and listed in [Appendix H](#).
2. If the value is for a parameter that should contain *fixed values*, the fixed values file list is checked; if the value is invalid for that parameter, a message is displayed and the value is rejected. Fixed values are listed in [Appendix B](#) and described in [Section 2.6.3](#).
3. If the value for pH (parameter code 00400) is greater than 14, a message is displayed and the value is rejected. If the value for pH is outside the range of 4.5 to 9.0, a message will be displayed during data entry, but the value will be retained.

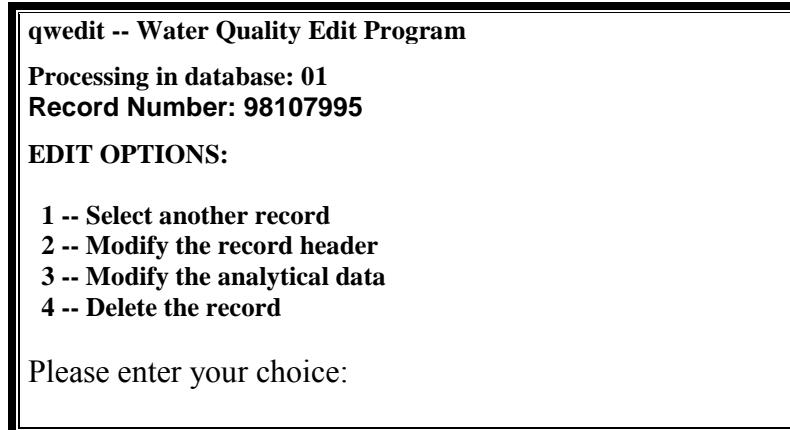

When data entry is complete, the record is stored and the dialog restarted with the request for a record number or “Q” to end. You will need to run the Chemical Validation Checks program described in [Section 3.3.5 \(Option 5 of Function 3, Data Review\)](#) to validate updates. General information about chemical validation checks is described in [Section 2.9.2](#).

### 3.2.3 Option 3 – Edit Samples or Results

The “Edit Samples or Results” program is used to modify the record header information for a sample, to modify the analytical results for a sample by adding, changing, or deleting parameter values or attributes, or to delete a sample record.

After selecting Option 3, you are prompted to enter the record number for the sample, or a carriage return to identify a sample by agency code, station number, start date, start time, end date, end time, and medium code. The record number and sample information are displayed, and you are asked if this is the desired record.

If this is not the desired record, or if the record is not found in the database, you are given another opportunity to enter either a record number or the agency code, station number, dates, times, and medium code. To quit from this application, enter a “Q” in place of the record number. After the desired sample is displayed and accepted by typing a “Y” or a carriage return, the following screen is displayed:

**Screen showing the edit samples and results options and record number of the sample.**

When a record has been retrieved, you are given four options: select another record, modify the record header, modify the analytical data, or delete the record. If you choose **Option 1 -- “Select another record,”** you are prompted and taken back to the previous screen to enter a record number or sample information. **Option 2 -- “Modify the record header”** allows you to change the sample header information and is the same program as described in the [Section 3.1 “Login Sample Program \(Section 3.1\)](#). **Option 3--Modify the analytical data,** allows you to add, change, or delete parameter values or attributes with the sample program as described in the [Enter Laboratory Results Program \(Section 3.2.2\)](#). **Option 4--Delete the record,** allows you to completely remove all parameter values and attributes as well as the sample header information. As a precaution, the program verifies the delete request by prompting:

Are you sure you want to DELETE that record? (Must answer YES)

You must reply by typing all of the letters in the word “**YES**” in capital letters before the record will be deleted. If the record is deleted, a line of text flashes across the bottom of the screen.

RECORD nnnnnnnn DELETED

Where “nnnnnnnn” is the sample record number. If the response to the prompt was something other than “**YES**,” the line

RECORD nnnnnnnn NOT DELETED

flashes across the bottom of the screen.

***NOTE: Deleted records or values are removed immediately and cannot be recovered except by reentering.***

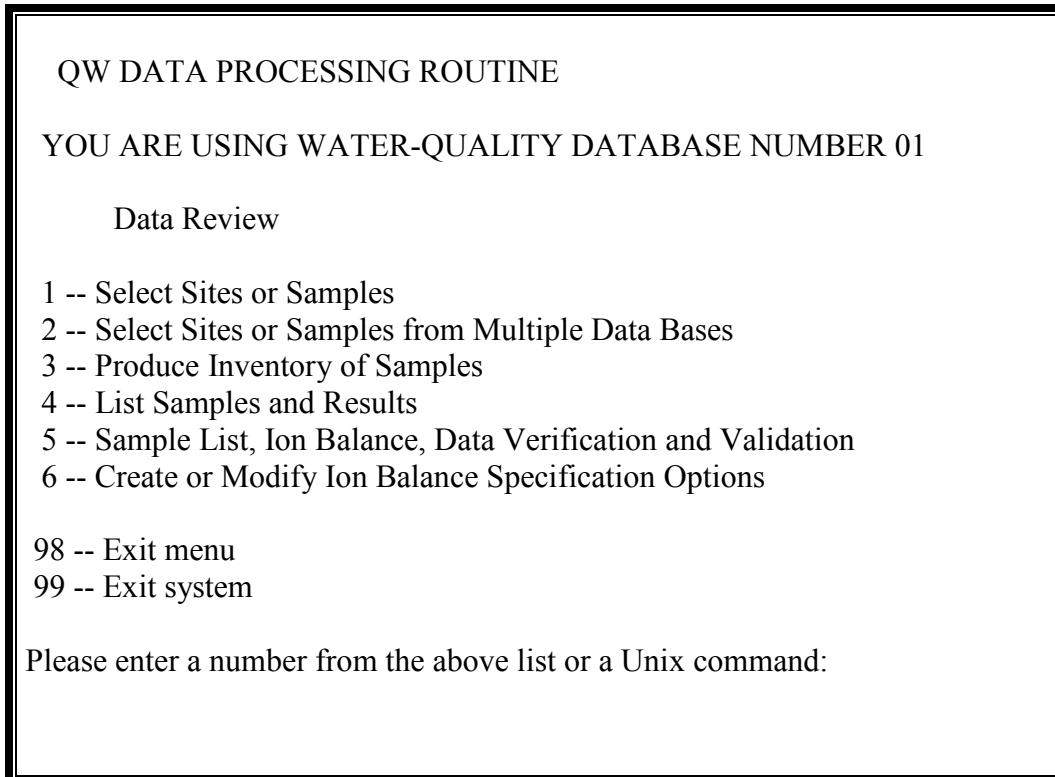

Exit this program by choosing **Option 1-- “Select another record,”** and then typing in a “**Q**” at the record number prompt or by entering “/q” in the data editing screen, then entering a “**Q**” at the record number prompt.

An alternative for deleting a record is to place the word “**DELETE**” in the “Aquifer Code” field —the 10<sup>th</sup> field in a tab-delimited sample-level batch file. This is explained in [Section 3.8](#).

It is recommended to run the “Data Verification” program located in the Data Review submenu described in [Section 3.3.5](#). Chemical Logic, Drinking Water Limits, and Data Validation checking routines can be selected to run simultaneously or independently.

### 3.3 Option 3 – Data Review Options

Data review functions include options to provide an inventory of records that have been logged into the database, view data stored in a sample record, produce standard and custom ion balance tables, provide chemical validations of sample analyses, and create or modify ion balance specifications. Option 3 of the main menu invokes the following Data Review options submenu.

**Data Review options menu**

#### 3.3.1 Option 1 – Select Sites or Samples

This option is used to create three types of files; (1) lists of sites that meet user-specified site selection criteria, (2) lists of sites that have water-quality data that meet user-specified site selection and sample selection criteria, and (3) lists of record numbers for water-quality data that meet user-specified sample selection criteria. These files may be used as input to other options in the NWIS-QWDATA system. The record number list file is required for [Generating Output to Files \(Section 3.4 – “Data Output”\)](#).

Sample selection is a two-step process. First, site numbers are specified using one of the first three options on the **Select Sites or Samples** submenu. By using Option 4, site selection is skipped—effectively selecting all sites in the database.

**qwsiterec -- locate record numbers for use by QW application programs**  
**QW database(s): 01**

**You may locate records for specific sites.**

**If you wish to locate records for specific sites the options are:**

- 1 -- You have a file containing agency codes and station ID's**
- 2 -- You will enter site numbers at terminal**
- 3 -- You wish to locate sites based upon selection criteria**

**If you don't care which sites the option is:**

- 4 -- Locate QW records without regard to site**

**Please enter option (1-4, Q to quit):**

**Site Specification menu within the “Select Sites or Samples” option.**

In the second step, sample records are selected for the designated list of sites based on user-specified criteria.

### 3.3.1.1 Site Selection

Station numbers may be provided to the software in three ways: (1) specified in a file that you provide, (2) from interactive entry, or (3) selected based on user-specified criteria. You also may choose not to specify station numbers (4).

1. If the station numbers are to be read from an input file, you will be queried for the file pathname. Station numbers must be listed using the fixed-column format shown in Appendix G. An output file from a previous site selection process is also an acceptable format for input (Appendix C).
2. If the station numbers will be entered interactively, you will be queried for agency code and station number. A null entry ends interactive station number entry.
3. If station numbers are to be selected from user-provided criteria, a list of available criteria for site selection is displayed as shown below.

**qwsiterec -- Locate sites**

**Enter an X to choose an item for limiting retrieval,  
Enter a # to remove an item.**

**(1) AGENCY CODE: \_ (2) STATE CODE: \_ (3) COUNTY CODE: \_  
(4) HYDROLOGIC UNIT: \_ (5) DRAINAGE BASIN: \_ (6) POLYGON: \_  
(7) RANGE OF STATION NUMBERS: \_ (8) SITE TYPE: \_ (9) SITE CHARACTERISTICS: \_**

**Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help**

**Menu for choosing the site selection criteria within the Select Sites or Samples submenu.**

The available selection criteria, which may be used in combination, and the specifications for each are shown below.

<b>Site selection criteria</b>	<b>Specifications</b>	<b>Source</b>
(1) Agency code	-- up to 10 agency codes	<a href="http://pubs.er.usgs.gov/publication/ofr20051251">http://pubs.er.usgs.gov/publication/ofr20051251</a>
(2) State code	-- up to 10 State codes	<a href="#"><i>FIPS code dictionary – See Sect. 3.6.5</i></a>
(3) County code	-- up to 40 county codes	<i>FIPS code dictionary – See Sect. 3.6.5</i>
(4) Hydrologic unit code	-- up to 10 hydrologic unit codes	<a href="http://pubs.er.usgs.gov/publication/ofr20051251">http://pubs.er.usgs.gov/publication/ofr20051251</a>
(5) Drainage basin code	-- up to 10 drainage basin codes	<a href="http://pubs.er.usgs.gov/publication/ofr20051251">http://pubs.er.usgs.gov/publication/ofr20051251</a>
(6) Polygon	-- up to 50 vertices	user specified
(7) Range of station numbers	-- only 1 range	user specified
(8) Site Type	-- up to 10 station types	<a href="http://pubs.er.usgs.gov/publication/ofr20051251">http://pubs.er.usgs.gov/publication/ofr20051251</a>
(9) Site Characteristics	See below for specifics	

Enter a nonblank character (other than “/”) to choose a field for limiting retrieval, or enter a “#” to remove a field. You may invoke the options for screen navigation during selection of retrieval criteria.

**(1) and (7)** If you select BOTH agency code and range of station numbers for site retrieval, only the first agency code entered is used in the search.

**(2)** If you select a State code for site retrieval, an additional query is included to ask for a country code:

To select by state need to specify country.

Enter 2-character country code (<CR>=US):

**(3)** For information on county codes, please refer to  
[http://pubs.er.usgs.gov/publication/ofr20051251.](http://pubs.er.usgs.gov/publication/ofr20051251)

(6) If records are to be retrieved by polygons, you will be queried for a file containing the vertices in fixed format. You may specify up to 50. The vertices should be stored in the format shown below.

Column	Format	Description
1–7	dddmmss	Latitude (right-justified in column 7)
9–16	dddmmss	Longitude (right-justified in column 16)

**File format for entering polygon vertices.**

Vertices also may be entered or selected interactively. You will first be asked if vertices are to be stored into a file. If “YES,” you will be queried for a filename. Next, you may choose to retrieve latitude-longitude values from the FIPSFILE—the 2-digit State code and the 3-digit county code are requested. A county code of 000 will retrieve the State record values. Optionally, you may choose to enter latitude-longitude pairs interactively from the terminal.

(8) If records are to be qualified by Site Type, you may request a maximum of 10 site type codes by entering primary or primary plus secondary site type codes. Enter a “?” to request a list of current codes. You may use a wildcard of an asterisk (\*) during the entry of site types.

(9) If records are to be qualified by Site Characteristics, select any one or more of the additional selection options shown below.

Selection criterion	Specification	Reference source
<b>Primary geologic unit</b>	-- up to 20 geologic unit codes	<b>Section 3.6.4</b>
<b>Use of site</b>	-- up to 10 use-of-site codes	<b>Appendix A</b>
<b>Use of water</b>	-- up to 10 use-of-water codes	<b>Appendix A</b>
<b>Well depth (range)</b>	-- only 1 range	<b>user supplied</b>
<b>Project ID</b>	-- up to 10 project ID's	<b>user supplied</b>
<b>Drainage area (range)</b>	-- only 1 range	<b>user supplied</b>

To be selected, a site record must satisfy all the selected criteria.

***NOTE: These selection criteria are optional fields in the SITEFILE record. If the selected field has not been populated in a site record, that site will fail the selection criterion.***

The speed of the SITEFILE retrieval will vary depending upon the amount of qualification by the selected criteria that you supplied. You will be given a warning and an opportunity to abort the SITEFILE search if the criteria are too general. If no site selection criteria are specified, the default condition is invoked and the selection criterion used is **Agency code = USGS**.

**qwsiterec – locate sites**

**Beginning search for sites in database 01 ...**  
**(No selection made -- will search for ALL station types)**

**This may take a long time as the entire site file must be read**

**Do you wish to continue (Y/N,<CR>=Y)?**

**Warning message when searching the entire SITEFILE.**

After the SITEFILE has been queried for sites that satisfy the user selection criteria, you will be asked if selected sites should be sorted. A response of “**YES**” invokes a prompt to select sorting options. All of the desired sort codes must be entered on one line without spaces. The first field will be the primary sort, the next will be the secondary sort, and so forth. In the example below, sites are sorted according to agency code, site type, and station number.

**qwsiterec -- total number sites located: 1050**

**Do you wish to sort the located sites (Y/N)? Y**

**You may sort on any combination of the following fields:**

<b>A -- Agency code</b>	<b>G -- Hydrologic unit</b>
<b>B -- Station number</b>	<b>H -- Drainage basin</b>
<b>C -- Station name</b>	<b>I -- Site type</b>
<b>D -- Latitude-longitude</b>	<b>J -- Use of water</b>
<b>E -- State</b>	<b>K -- Geologic unit</b>
<b>F -- County</b>	<b>L -- Project</b>

**The first field will be the primary sort  
the next will be the secondary sort 1, ...  
Please enter the sort codes on one line with no embedded spaces**

**Enter sort code(s): AIB**

**User is given the option to sort retrieved sites.**

When the sort is complete or if the sort option is skipped, you will be prompted to enter a filename to hold the retrieved site numbers. The site numbers and associated location and other site information are saved in a file using a fixed-column format shown in [Appendix C](#).

If you choose not to specify site numbers in the Select Sites or Samples submenu, the program moves to the option to select water-quality records.

### 3.3.1.2 Selecting Water-Quality Records

After sites are selected, you may select water-quality records for the specified sites or you may return to the Data Review menu. To select water-quality records, a screen is displayed to specify selection criteria. If no water-quality record selection criteria are specified, by entering a <CR> in the (1) DATE field, the program will use a default date range from 1776 to present—in effect, selecting all records in the database and a default sample analysis status code setting.

The default analysis status code ([Appendix A](#)) setting is determined by the types of databases included in the retrieval. The default for an environmental database is to include all unrestricted samples; the default for quality-control databases is to include all unrestricted and internal-use samples. If a retrieval from multiple databases is made that includes both environmental and quality-control databases, then the default is all unrestricted and internal-use samples.

**Locate QW records**

**Enter an X to choose an item for limiting retrieval.**

**Enter a # to remove an item.**

**(1) DATE: \_ (2) MEDIUM CODE: \_ (3) ANALYSIS-LEVEL CODES: \_  
(4) PROJECT ID: \_ (5) GEOLOGIC UNIT: \_ (6) PARAMETER VALUES AND CODES: \_  
(7) PARAMETER GROUPS: \_ (8) DATA QUALITY INDICATOR CODES: \_**

**Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help**

**Selection options for locating water-quality records.**

Select water-quality records by using any combination of eight selection criteria as shown below.

	<b>Selection criterion</b>	<b>Specification</b>	<b>Reference source</b>
(1)	<b>DATE (range)</b>	-- 1 date range	user supplied
(2)	<b>MEDIUM CODE</b>	-- up to 43 medium codes	<a href="#">Appendix A</a>
(3)	<b>ANALYSIS-LEVEL CODES</b>		
	<b>Hydrologic condition code</b>	-- up to 6 hydrologic condition codes	<a href="#">Appendix A</a>
	<b>Sample type code</b>	--up to 6 sample type codes	<a href="#">Appendix A</a>
	<b>Hydrologic event code</b>	-- up to 10 hydrologic event codes	<a href="#">Appendix A</a>
	<b>Collecting agency code</b>	--up to 20 collecting agency codes	<a href="#">Appendix K</a>
	<b>Analysis status code</b>	--up to 3 analysis status codes	<a href="#">Appendix A</a>
(4)	<b>PROJECT ID</b>	-- up to 10 project ID's	user supplied
(5)	<b>GEOLOGIC UNIT</b>	-- up to 10 geologic unit codes	<a href="#">Section 3.6.4</a>
(6)	<b>PARAMETER VALUES AND CODES</b>		
	<b>Parameter codes</b>	-- up to 50 parameter codes	<a href="#">Section 3.6.3</a>
	<b>Parameter values</b>	-- up to 50 parameter value minimums and/or maximums	user supplied
	<b>Remark codes</b>	-- up to 5 remark codes per parameter	<a href="#">Appendix A</a>
	<b>Method codes</b>	-- up to 5 method codes per parameter	<a href="#">Section 3.6.8</a>
	<b>Prep set number</b>	-- one prep set number per parameter	user supplied
	<b>Analysis set number</b>	-- one analysis set number per parameter	user supplied
	<b>Value qualifier code</b>	-- up to 5 value qualifier codes per parameter	<a href="#">Appendix A</a>
	<b>Analyzing entity</b>	-- one analyzing entity code per parameter	<a href="#">Appendix K</a>
(7)	<b>PARAMETER GROUPS</b>	-- up to 15 parameter group codes	<a href="#">Appendix N</a>
(8)	<b>DATA QUALITY INDICATOR CODES</b>	-- up to 9 DQI codes	<a href="#">Appendix A</a>

#### **Record selection criteria, specifications, and reference source.**

You can get all stored records for a site if (1) **DATE** is used for the selection of records and you enter a <CR> for both the begin date and end date. In any release after NWIS 4.2, the storage of times in the Coordinated Universal Time (UTC) System may result in small numbers of samples not being included in retrievals limited by date. The retrieval program will use the time variable set for the UNIX environment on the local computer system. To avoid missing samples in a date range, you could include an extra day on either end of the desired date range. The examples below demonstrate this behavior.

A. Sample in Arizona database from Navajo reservation (the Navajo reservation observes daylight saving time, but the rest of the State does not)

1. UNIX time variable is US/Arizona
2. Sample begin date/time logged in as: 10-01-02 @ 0030 MDT
3. Sample begin date/time stored in UTC as: 10-01-02 @ 0630 UTC
4. Retrieval of all records in a water year as entered on the screen:  
Begin date: 10-01-02  
End date: 09-30-03
5. Retrieval date range converted to:  
Begin date: 10-01-02 @ 07:00:00 UTC  
End date: 10-01-03 @ 06:59:59 UTC

Due to the conversion to UTC for retrieval, this sample is *not* included in the retrieval even though it was collected in the date range selected.

B. Sample from Indiana in a county near Chicago, Illinois

1. UNIX time variable is US/East-Indiana
2. Sample begin date/time logged in as: 09-30-02 @ 2345 CST
3. Sample begin date/time stored in UTC as: 10-01-02 @ 0545 UTC
4. Retrieval of all records in a water year as entered on the screen:  
Begin date: 10-01-02  
End date: 09-30-03
5. Retrieval date range converted to:  
Begin date: 10-01-02 @ 05:00:00 UTC  
End date: 10-01-03 @ 04:59:59 UTC

Due to the conversion to UTC for retrieval, this sample is included in the retrieval even though it was not collected in the date range selected.

C. Sample from the East Coast of the United States

1. UNIX time variable is US/Eastern
2. Sample begin date/time logged in as: 09-30-02 @ 2300 EST
3. Sample begin date/time stored in UTC as: 10-01-02 @ 0400 UTC
4. Retrieval of all records in a water year as entered on the screen:  
Begin date: 10-01-02  
End date: 09-30-03
5. Retrieval date range converted to:  
Begin date: 10-01-02 @ 04:00:00 UTC  
End date: 10-01-03 @ 03:59:59 UTC

Due to the conversion to UTC for retrieval, this sample is included in the retrieval although it was not collected in the date range selected.

D. Sample from the East Coast of the United States

1. UNIX time variable is US/Eastern
2. Sample begin date/time logged in as: 09-30-03 @ 2330 EST
3. Sample begin date/time stored in UTC as: 10-01-03 @ 0430 UTC
4. Retrieval of all records in a water year as entered on the screen:  
Begin date: 10-01-02  
End date: 09-30-03
5. Retrieval date range converted to:  
Begin date: 10-01-02 @ 04:00:00 UTC  
End date: 10-01-03 @ 03:59:59 UTC

Due to the conversion to UTC for retrieval, this sample is *not* included in the retrieval although it was collected in the date range selected.

If you specify a selection based on **(2) MEDIUM CODE**, the following menu appears on the screen.

**Enter medium code:**

(Use a "\*" for a wildcard search. For example. "W\*" selects all "Water" media; "\*Q" selects all QC media)

**(1) MEDIUM CODE: \_\_\_\_**

Selection of criteria based on **(3) ANALYSIS-LEVEL CODES** or **(6) PARAMETER VALUES AND CODES** each invoke another menu described below.

If you specify a selection based on **(3) ANALYSIS-LEVEL CODES**, the following menu is invoked. You may select one or more of the selection criteria.

**Locate QW records**

Enter an X to choose an item for limiting retrieval,  
Enter a # to remove an item.

**(1) HYDROLOGIC CONDITION: \_ (2) SAMPLE TYPE: \_ (3) HYDROLOGIC EVENT: \_  
(4) COLLECTING AGENCY: \_ (5) ANALYSIS STATUS: \_**

Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help

**Options for selecting water-quality records based on analysis-level codes.**

If you specify a selection based on **(5) ANALYSIS STATUS**, the following menu is invoked. Valid codes are “U,” “I,” and “P.” General information about analysis status codes is available in [Section 2.4.10](#). Additional information about coding the analysis status for any sample is available in [Section 3.7.5](#).

**Enter up to 3 Analysis Status codes:**

**(1) Analysis Status Code: \_**

**Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help**

**Screen for selecting water-quality records based on analysis status codes.**

The default behavior is important to note for records retrieval. When querying QWDATA from an environmental database (typically numbered “01”), the program will include only records where analysis status is set to “U – unrestricted.” If you are searching for records from a QC database, the program will search for records of analysis status of either “U” or “I –internal-use only.” The only means of searching for proprietary samples from this menu option is to include records where analysis status = “P.” The default behavior will be followed unless you select different options at this menu.

You will be notified that the database search has begun. After water-quality records are retrieved (and if the number of records retrieved are greater than zero), the number of records and the number of sites are displayed on the screen. Note the message line that indicates which analysis-status codes are being excluded:

```
qwsiterec -- locating QW records
Beginning search for QW records in database 01 ...
Search excludes internal-use and proprietary samples (default)
... end of search. 12227 records ( 212 sites) located in database 01
```

**Do you wish to save a list of sites that have QW data (Y/N)? Y**

```
Enter pathname of file to hold list of sites with QW data for database 01 --
:
```

**The user is notified of the number of water-quality records retrieved, which analysis status code types are excluded, and the number of sites for those records. The user is given the option to save a list of sites for which water-quality records were selected.**

Users with read-only access to the database table being queried will not be able to locate records with an analysis status = “I” or “P.”

If you specified a selection based on **(4) PROJECT ID**, then you will have an opportunity to enter up to 10 project-ID searches. The search text may use an asterisk (“\*”) as a wildcard for matching multiple project identifiers. For example, the search text “4630148\*” will retrieve any sample where the stored project identifier begins with these seven digits. Any lower-case letters in the search text are automatically converted to upper case before the search begins. Thus, this search criterion will not find samples with project identifiers stored with lower-case letters.

If you specify a selection based on **(6) PARAMETER VALUES AND CODES**, the following series of menus is invoked. On the first menu, you have the option of restricting parameter selection by selecting “**NOT**.” Use this option to select records for which parameter(s) identified in the next step do not exist. For example, if you select the “**NOT**” option and parameter code 00010, only records without parameter code 00010 (water temperature) will be retrieved.

Next, you will be asked to specify the first parameter code for selection. You may also specify minimum and maximum values for that parameter code as well as other result level codes listed in the screen below. You can retrieve null values by inserting a “.” in the “**MIN**” field.

<b>Parameter code/value tests</b>	
<b>NOT: _ (X qualifies records if specified parameters do not exist)</b>	
<b>Enter up to 50 tests--</b>	
(1)    PARM: 00010 MIN: 15    MAX: 30    RMK: _____	
METH: _____ PREP SET NUMBER: _____	
ANL SET NUMBER: _____ VAL QUAL CODE: _____	
ANL ENTITY: _____	
(2) A/O: O PARM: 00300 MIN: 4    MAX: _____ RMK: _____	
METH: _____ PREP SET NUMBER: _____	
ANL SET NUMBER: _____ VAL QUAL CODE: _____	
ANL ENTITY: _____	
(3) A/O: _ PARM: _____ MIN: _____ MAX: _____ RMK: _____	
METH: _____ PREP SET NUMBER: _____	
ANL SET NUMBER: _____ VAL QUAL CODE: _____	
ANL ENTITY: _____	
<b>Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help</b>	

Screen for selecting water-quality records based on parameter codes.

You may select more than one parameter code. Selection by parameter codes and values is the only selection that does not require that the specified criteria must be satisfied to qualify a water-quality record for selection. If you specify more than one parameter code, then for *each parameter after the first*, you will be asked whether the relation to the previous parameter is “AND” or “OR.” The “AND” or “OR” option in combination with the “NOT” option results in specific actions based on the rules of Boolean logic ([Section 2.2.6 – Getting Started](#)). Examples are shown in the table below.

First specification	Second specification (P1=parameter code 1, etc.)	Action selects records that...
NOT	P1, AND P2	do not contain values for both P1 and P2
NOT	P1, OR P2	do not contain values for either P1 or P2
--	P1, AND P2	contain values for both P1 and P2
--	P1, OR P2	contain values for either P1 or P2
--	P1, OR P2, AND P3	contain values for either P1 or both P2 and P3
NOT	P1, OR P2, AND P3	do not contain values for either P1 or both P2 and P3

**Actions of NOT, AND, and OR specifications for record selection based on result-level codes.**

If you specify a selection based on **(7) PARAMETER GROUP CODE**, the following menu appears on the following screen.

Enter up to 15 parameter group codes:

(1) PARAMETER GROUP CODE: INF  
 (2) A/O: A PARAMETER GROUP CODE: PHY  
 (3) A/O: O PARAMETER GROUP CODE: INN  
 (4) A/O: \_ PARAMETER GROUP CODE:  
 Options: ? ^D # / /x /+x /-x /@ /c /q – Enter ?? for help

**Screen for selecting water-quality records based on parameter group codes.**

You may select up to 15 parameter group codes. If you specify more than one parameter group code, then for *each parameter group code after the first*, you will be asked whether the relation to the previous parameter is “AND” or “OR.” The “AND” or “OR” option results in specific actions based on the rules of Boolean logic ([Section 2.2.6 – “Getting Started”](#)).

If you choose to retrieve based on **(8) DQI CODES**, the results available are based on your access level. If you have read-only access, you will be able to retrieve only records with DQI codes of “A,” “S,” or “R.” If you have read and write access, you will be able to retrieve records with any DQI code.

You will be asked if the list of sites with water-quality data should be saved. If you respond “**YES**,” you will be prompted to enter the pathname for the file. Next, you will be asked if the water-quality record numbers should be sorted. If not sorted, the file will list records in record number order. The retrieved record numbers may be sorted on any combination of the following fields.

**qwsiterec -- Total number QW records located: 12227**

**Do you wish to sort the located QW records (Y/N)? Y**

**You may sort on any combination of the following fields:**

**A -- Agency code                  F -- Geologic unit code**

**B -- Station number                G -- County code**

**C -- Dates and times              H -- Station name**

**D -- Medium code                 I -- Site type**

**E -- Project ID**

**The first field will be the primary sort**

**the next will be the secondary sort 1, ...**

**Please enter the sort codes on one line with no embedded spaces**

**Enter sort code(s):**

**User is notified of the number of water-quality records retrieved and  
given the option to sort the record numbers.**

All of the desired sort codes must be entered on one line without spaces. The first field will be the primary sort, the next will be the secondary sort, and so forth. When the sort is complete or if the sort option is skipped, you will be prompted to enter a filename to hold the retrieved list of record numbers. An example of output of record numbers from this program is shown in

[Appendix C](#).

### 3.3.2 Option 2 – Select Sites and Samples from Multiple Databases

Water-quality data from as many as five databases may be retrieved, as shown on the following screen. The multiple database retrieval option is most often used when data must be retrieved from the environmental database and the quality-assurance database. You may enter database numbers in any order. After the desired database numbers are entered, the user input is the same as that described in [Section 3.3.1](#). The output to the screen informs you of the results of selections for each database that you had specified.

```
qwmdb_loc -- locate site numbers/qw records for multiple databases
Enter up to 5 database numbers --
(1) DATABASE NUMBER: ___
Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help
```

**User is prompted to enter database numbers when multiple databases need to be accessed.**

If selection criteria are used to retrieve a site list (Option 3, below), a single set of criteria is used for all databases. After the sites are retrieved, you will be prompted to sort the list of sites and to save a file for the list of sites from each database.

**You may locate records for specific sites.**

**If you wish to locate records for specific sites the options are:**

- 1 -- You have a file containing site numbers**
- 2 -- You will enter site numbers for each database at terminal**
- 3 -- You wish to locate sites based upon selection criteria**

**If you don't care which sites the option is:**

- 4 -- Locate QW records without regard to site**

**Please enter option (1-4,Q to quit):**

**User may enter site numbers from a file, from the terminal, based on selection criteria, or may locate records without specifying site numbers.**

If water-quality records are retrieved, one file that contains the record numbers from all databases is output, and a database number is attached to each record number to identify the location of the data ([Appendix G](#)). You will be prompted to save a list of sites that have water-quality data for each database.

### 3.3.3 Option 3 – Produce Inventory of Samples

This option is used to produce a table of information for records that have been logged into the database for samples collected within a specific water year. This program has historically been identified as the “loglist” program. The table may be limited to a user-supplied list of up to 50 station numbers, or a range of dates within the specified water year, or both. An example of the output from this program is included in [Appendix C](#). This tabular output is written to a file, which you may print. Included in this output is information on the total number of parameters and the number of analyses in each parameter-sequence group. The parameter-sequence group codes, short names, and descriptions are listed in [Appendix N](#). The number of parameters in each group includes only stored parameters. Calculated parameters or those accessed from the SITEFILE, ADAPS, or GWSI are not included in the parameter count.

You will first be queried for the name of a file to hold the output. The filename may include the pathname if you do not wish to save the file in the current directory. If the specified file already exists, it may be either appended or overwritten, according to your response. Enter the water year next. Within the selected water year, the table may be restricted to specific station numbers and a range of dates. Station numbers may be entered interactively or from a [fixed-column format file](#). Station numbers also are accepted in the format used to output stations under [menu Option 3.3.1](#). Sites also may be input interactively without an agency code.

```
QW LOGLIST PROGRAM  
THU, MAR 22 2001  
PLEASE ENTER NAME OF FILE TO HOLD THE OUTPUT: loglist  
PLEASE ENTER THE WATER YEAR (4 DIGITS)  
1973  
DO YOU WANT INFORMATION FOR SPECIFIC STATIONS (YES OR NO) ?  
N  
DO YOU WANT INFORMATION FOR A RANGE OF DATES (YES OR NO) ?  
N  
Searching ...  
1715 RECORDS RETRIEVED  
RECORDS ARE ORDERED BY RECORD NUMBER  
DO YOU WANT THEM SORTED ON SOME OTHER FIELD (YES OR NO)?
```

**Screen queries for producing an inventory of samples  
in the water-quality database.**

When the selected records have been retrieved, they are ordered by record number. You will be given the option to sort the records by up to seven sort fields [record number, station number, sample start date, medium code, project ID, date of last update, and analysis status code ([Appendix A](#))]. Enter sort selections on one line without embedded spaces. The first sort option

entered is the primary sort, the second sort option entered is the secondary sort, the third sort option entered is the tertiary sort, and so forth.

<p>You may sort on any combination of the following fields:</p> <p>A -- Record number      E -- Project ID B -- Station number      F -- Date of last update C -- Sample start date    G -- Analysis status D -- Medium code</p> <p>The first field will be the primary sort the next will be the secondary sort 1, ... Please enter the sort codes on one line with no embedded spaces</p> <p>Enter sort code(s): BC</p> <p>Beginning sort ... ... sort completed.</p> <p><b>DO YOU WANT ANOTHER WATER YEAR (YES OR NO)?</b></p>
---

**Screen queries for sorting the sample inventory file.**

When the sort request is complete, you will be asked if data for another water year are to be retrieved. If you respond “**YES**,” the queries described above are repeated beginning with entry of station numbers, or date range, or both. If you respond “**NO**,” you will be returned to the Data Review menu.

### 3.3.4 Option 4 – List Samples and Results

Sample information and analytical results for requested records can be displayed to the screen or a file. Records may be identified by record number or by agency, station number, date, time, and medium code. You will first be given the option to enter record selection information interactively or to input this information using an existing file. **Note: The minimum identifying information needed to uniquely identify a sample is agency code, station number, date, and medium code.**

To retrieve a record using sample identification information, all information that has been entered for a particular sample must be specified. The fields that could be completed are agency, station number, date, medium code, time, end date, and end time. For example, if all of these fields were populated for a particular sample, then all of the fields must be used to identify and retrieve the sample. Typically, samples are uniquely identified with agency code, station number, date, time, and medium code.

If the list of records is to be entered from a file, you will be prompted for the filename and input format of either **1 for Record Number, or 2 for Agency Code, Station Number, Date, Time, and Medium Code.**

*qwlist processing in database: 01*

**Do you want to enter record selection numbers from the terminal? (y,n <CR>=y): n**

**Enter the pathname of the input file (q to quit): test3**

**Do you want to identify records by:**

**1. Record Number**

**2. Agency Code, Station Number, Date, Time**

**Please enter option (1,2,q, <CR>=1): \_**

**Entering a file to retrieve a list of sample information.**

If the records are to be identified by record number, the format of the file is one record number per line, with the 8-digit record number beginning in column 1 of each line as shown in [Appendix G](#).

Additional information may be included beyond column 8 so that output from other options (such as the record file output from the [Select Sites and/or Samples](#) option shown in [Appendix C](#)) may be used.

Input files containing records identified by agency, station number, date, time, and medium code must follow the format shown in [Appendix G](#).

The next query gives you the option to print the output to the screen or to a file. You will be queried for an output filename if the file output option is selected. You will next be given the choice between two report formats, the short form or the long form, which is about 161-characters wide. These two options are also available for display to the screen, shown in [Appendix C](#). The output is sorted in the same order as the input records. **Note: The analytical results are displayed using unrounded values from the database.**

<p><i>qwlist processing in database: 01</i></p> <p><i>Do you want the report to be printed to the screen? (y,n, &lt;CR&gt;=y): _</i></p> <p><b>Select report:</b></p> <p>1 -- short form 2 -- long form</p> <p><b>Please enter selected report (1,2,q, &lt;CR&gt;=1): 2</b></p>
---

**Output option queries for List Samples and Results. This example specifies output to the terminal (screen) using the long form.**

If you chose to input record information interactively from the terminal, the next screen allows you to enter record numbers or agency code, station number, date, time, and medium code.

<p><i>qwlist processing in database: 01</i></p> <p><b>Do you want to enter record selection numbers from the terminal? (y,n &lt;CR&gt;=y):</b></p> <p><b>Enter record numbers, ("A" to select by agency-site-date-time-medium or ,&lt;CR&gt; to quit</b></p> <p><b>1: <u>00200111</u></b> <b>2: _____</b></p>
---

**Interactive record input screen for producing output from the List Samples and Results option.**

The requested record information will be listed on the screen or to a file in the specified format until you enter a carriage return for record number to end the program.

<p><i>qwlist processing in database: 01</i></p> <p><b>(1) Agency Code: USGS (2) Site Number: _____</b> <b>(3) Begin Date: YYYYMMDD (4) Begin Time: HHMM</b> <b>(5) End Date: YYYYMMDD (6) End Time: HHMM</b> <b>(7) Medium Code: ___</b> <b>Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help</b></p>
--

**Screen for entering agency, site number, date, time, medium code for producing output from the List Samples and Results option (shaded text indicates mandatory items).**

**Note: Begin time, end time, and end date are not required fields on input. If these fields have been populated in a sample record, however, they must be entered here to retrieve the record.**

### 3.3.5 Option 5 – Sample List, Ion Balance, Data Verification and Validation

From this option, output is produced that includes: (1) a list of parameters and their values, (2) a cation-anion balance table, (3) data verification and validation check results, or (4) all for specific samples. You may choose to calculate the ion balance table using the standard calculation method or may supply a file that specifies the information needed to produce a customized ion balance calculation, as described in [Section 3.3.6.2](#). You can specify samples by record number or by sample key information (agency code, site number, date, time, and medium code); you may enter this information from the terminal or a file. If sample identifiers are entered from a file, you will be queried for the name of a file (full pathname allowed, up to 32 characters) that contains either record numbers or agency code, station number, date, time, and medium code in the format shown above. If you enter record numbers from the terminal, the program queries you for another record number after each sample is processed. Enter <CR> in the record number field to terminate processing.

**Do you want to enter record selection numbers from the terminal? (y,n, <CR>=y): \_**

Enter record numbers ("A" to select by agency-site-date-time-medium  
or <CR> to quit

1: 00100234

2: \_\_\_\_\_

#### Queries for record selection.

The sequence of samples in the output listing can be in the same order as the specified records, or the samples may be sorted by the stored project number ([Section 2.4.16](#)).

**Do you want the output sorted by:**

1. the order in the supplied record number list
2. project number

**Please enter option (1,2,q, <CR>=1): \_**

You may select from six data verification options. Next, you will be queried for the name of a file to hold the output. The file is saved with Fortran page-control characters. To print the file, the following UNIX command usually works.

**asa filename |lp -ylandscape -dprintername**

**Data Verification Options:**

- |   |   |  |
|---|---|--|
| <b>1. List All Parameters and Results:</b>                      | <input checked="" type="checkbox"/> Yes | <input type="checkbox"/> No            |
| <b>2. Create Cation/Anion Balance Table:</b>                    | <input type="checkbox"/> Yes            | <input checked="" type="checkbox"/> No |
| <b>3. Perform Chemical Logic Checks:</b>                        | <input checked="" type="checkbox"/> Yes | <input type="checkbox"/> No            |
| <b>4. List Results that Exceed USEPA Drinking Water Limits:</b> | <input checked="" type="checkbox"/> Yes | <input type="checkbox"/> No            |
| <b>5. List Results that Exceed User-Specified Limits:</b>       | <input type="checkbox"/> Yes            | <input checked="" type="checkbox"/> No |
| <b>6. Perform Data Validation Checks:</b>                       | <input checked="" type="checkbox"/> Yes | <input type="checkbox"/> No            |

Changes? Enter item number to change or <CR> to continue:

**Data verification output options.**

The following describes the actions taken and the output for each **Data Verification** menu option. Example output files are shown in [Appendix C](#).

**1. List All Parameters and Results:** If you choose to output all parameters and results, all results for the sample are written in the same format as the WATLIST report as shown in [Appendix C](#).

**2. Create Cation/Anion Balance Table:** If you choose to output a cation-anion balance table, there will be an option to create an output file containing the ion balance results. If you request such an output file, a tab-delimited “rdb” style file is created. An example output file is shown in [Appendix C](#). A reference table defines the parameter codes that are used in all programs that produce an ion balance table (WATLIST, qwvalid, qwbal). This reference table includes: the parameter code; a flag indicating if the parameter is calculated; a multiplication factor to convert the result units to milliequivalents per liter units; the ion type (cation or anion); the group that the parameter belongs to (e.g., alkalinity, nitrogen species); a flag indicating if the parameter is a major ion, the hierarchy of similar parameters within a group (e.g., if multiple alkalinity parameters are present, which is used in the calculation); and the order of the ions in the table output. This table may be updated quarterly. A listing of these parameters is shown in [Appendix L](#).

You may request a customized ion balance calculation by specifying a user-specified table and by supplying a custom ion balance specifications file. This is the only program in QWDATA that allows users to customize the ion balance. This file gives the software explicit instructions on how to calculate the table, which parameters are considered cations or anions, what multiplication factor should be used, what order the parameters are to be included in the output, and the hierarchy of parameters within the same group. The format for this file is shown in [Appendix C](#). You may create your own file or may modify the standard ion balance specifications file produced in “Data Review” Option 6 described in [Section 3.3.6](#).

Do you want a cation-anion balance table? (y,n,q, <CR>=y):\_

**Do you want to create a tab-delimited output file of  
ion balance results? (y,n,q, <CR>=n): \_**

Enter name for tab-delimited output file (q to quit): \_\_\_\_\_

Do you want the standard cation-anion  
balance table? (y,n, <CR>=y; n=user-specified table): n  
Enter custom cation-anion balance specifications  
file name (q to quit): ion.bal.spec.file

**Queries for type of ion balance table and specifications filename.**

The output file containing parameters, or ion balance tables, or both is saved with Fortran page-control characters, and it should be printed using these page-control characters. The following UNIX command usually works.

**asa filename |lp -yandscape -dprintename**

An example of output from this program is shown in [Appendix C](#). Analytical results are included in this output and are unrounded. Cation and anion values are shown unrounded for the original parameter units; values calculated as milliequivalents per liter are rounded to 3 digits after the decimal in the output table and tab-delimited output files. Calculations of cation sum, anion sum, and percent difference are made using unrounded results. Results that have remark codes may be included in the cation-anion balance table and these codes may affect how the ion balance is computed, as shown in the following table.

<b>Remark code</b>	<b>Description</b>	<b>How handled in Ion Balance Calculation</b>
<b>E</b>	Estimated Value	<ul style="list-style-type: none"> <li>Result used in calculation.</li> <li>Remark code "E" will be shown next to result.</li> </ul>
<	Less than	<ul style="list-style-type: none"> <li>Results for major and minor ions will be used in the calculation.</li> <li>Remark code "&lt;" will be shown before the parameter result.</li> <li>The ion balance will be calculated using the minimum possible value (=0) and the maximum possible value below the censored value.</li> <li>Result in the ion balance table will be shown as a <b>range</b> of possible cation totals, in milliequivalents per liter, anion totals in milliequivalents per liter, and balance in percent difference.</li> <li>Result in the tab-delimited output file will be the average of the range.</li> </ul>
>	Greater than	<ul style="list-style-type: none"> <li>Results for major and minor ions will be used in the calculation.</li> <li>Remark code "&gt;" will be shown next to the parameter result.</li> <li>The ion balance will be calculated using the result value, ignoring the "&gt;" remark.</li> </ul>
<b>M</b>	Presence verified, not quantified	<ul style="list-style-type: none"> <li>Null result will be treated as missing result and will be ignored in calculation.</li> <li>Program will search for next parameter in hierarchy.</li> <li>If no other parameter in hierarchy group is available, remark code "M" shown as result in ion balance table.</li> <li>Last parameter code in the hierarchy will be listed.</li> </ul>
<b>N</b>	Presumptive evidence of presence	<ul style="list-style-type: none"> <li>Null result will be treated as missing result and will be ignored in calculation.</li> <li>Program will search for next parameter in hierarchy.</li> <li>If no other parameter in hierarchy group is available, remark code "N" shown as result in ion balance table.</li> <li>Last parameter code in the hierarchy will be listed.</li> </ul>
<b>U</b>	Analyzed for, not detected	<ul style="list-style-type: none"> <li>Null result will be treated as missing result and will be ignored in calculation.</li> <li>Program will search for next parameter in hierarchy.</li> <li>If no other parameter in hierarchy group is available, remark code "U" shown as result in ion balance table.</li> <li>Last parameter code in the hierarchy will be listed.</li> </ul>
<b>A</b>	Average value	<ul style="list-style-type: none"> <li>Result used in calculation.</li> <li>Remark code "A" shown next to result.</li> </ul>
<b>V</b>	Value affected by contamination	<ul style="list-style-type: none"> <li>Result used in calculation.</li> <li>Remark code "V" shown next to result.</li> </ul>
<b>S</b>	Most probable value	<ul style="list-style-type: none"> <li>Result used in calculation.</li> <li>Remark code "S" shown next to result.</li> </ul>

**Table showing how results with remark codes are used in the ion balance calculation.**

**3. Perform Chemical Logic Checks:** Chemical logic checks are performed for specific samples when this option is selected. The chemical logic checks include the checks performed when

batch processing programs are used and the results are printed in the WATLIST file (example in [Appendix C](#)). A detailed listing of the chemical validation checks in QWDATA is listed in [Appendix M](#). In general these checks include:

- Field measurement results against general guidelines;
- Chemical logic;
- Bacterial logic;
- Comparisons between stored calculated parameters and current calculated values;
- Both values are first rounded using default rounding as described in [Section 3.4.3.4](#);
- Comparisons between related constituents;
- Comparisons between unfiltered and filtered constituents,
- Comparisons between selected constituents and individual parameters that make up the sum of parts;
- Comparisons of constituents to alert limits in [Appendix E](#); and
- Calculation of a cation/anion balance.
  - In NWIS 4.6, an option to specify the parameters used in calculating the cation/anion balance was added. This option is described in more detail in [Section 3.3.6](#).

**4. List Results that Exceed EPA Drinking Water Limits: Results for specific samples are compared automatically to the U.S. Environmental Protection Agency (EPA) Primary Drinking Water Maximum Contaminant Levels and Secondary Maximum Contaminant Levels when this option is selected.** Results with remark codes of “E,” “A,” “S,” “V,” or “>” are allowed. The EPA Drinking Water Limits are listed in [Appendix E](#). A warning message, which includes the parameter code, parameter short name, remark code, result, units, and alert limit is written for results that exceed the limit (example in [Appendix C](#)). The comparisons include the comparisons performed when batch processing programs are used and the results are printed in the WATLIST file (example in [Appendix C](#)).

**5. List Results that Exceed User-Specified Limits:** The data review and batch-processing programs automatically compare selected result values to the U.S. Environmental Protection Agency (EPA) Primary Drinking Water Maximum Contaminant levels and Secondary Maximum Contaminant Levels; however, users also may have the need to compare results to other Federal, State, and local regulatory standards for waters used for specific purposes. User-specified alert limit forms are used by data review and batch-processing programs in QWDATA to provide the user with the option to compare results to these other Federal, State, and local regulatory standards.

You may add new user-specified alert limit forms to be used in QWDATA by creating a form using a specific format and storing it in the /usr/opt/nwis/data/auxdata/qw\_alert\_limits directory. Alert limit form names are in the format alert.limitnn where “nn” is the 2-digit number that

identifies the form. Instructions for creating the user-specified alert limit form are found in [Section 2.9.2.1.1](#), and an example of the form is shown in [Appendix G](#). You should create new user-specified alert limit forms if none of the available alert limit forms fit the data to be entered. Review available user-specified alert limit forms prior to creating a new form so that duplication of user-specified alert limit forms is avoided.

Selected result values are compared to the user-specified alert limits when you select this option. You have the option to select one or more user-specified alert limit file number(s), or you may specify “all” to use all available files.

**Enter alert limit file number(s), comma separated, or "all" to use all available files: (q to quit, ? to search, <CR>=none)**

A warning message, which includes the parameter code, parameter short name, remark code, result, units, and alert limit, is written for results that exceed the user-specified limit (example in [Appendix C](#)).

**6. Perform Data Validation Checks:** Data validation checks are performed for specific samples when this option is selected. The data validation checks include the checks performed when batch processing programs are used, and the results are printed in the WATLIST file (example in [Appendix C](#)). A detailed listing of the data validation checks in QWDATA is given in [Appendix M](#). In general, these checks include:

- Station number does not exist in the SITEFILE,
- Invalid geologic-unit code,
- Invalid sample type, analysis status, hydrologic condition, or hydrologic event codes,
- Sample-preparation or sample-analysis date prior to sample-end date,
- Fixed-value parameter is incompatible with measurement-parameter attributes, such as remark code,
- Invalid fixed-value parameter value.
- A null-value remark code accompanies a non-null result value, and
- Invalid method code.

### 3.3.6 Create or Modify Ion Balance Specification Options

You may output the specifications file that defines how the standard ion balance is calculated. Sample output from this program is in [Appendix C](#).

#### Create or Modify Ion Balance Specification Options

1 -- Dump standard ion balance specification file  
2 -- Create or edit custom ion balance specification file

98 -- Exit menu

99 -- Exit system

Please enter a number from the above list or a Unix command:

**Queries for creating an ion balance specification file.**

#### 3.3.6.1 Dump Standard Ion Balance Specification File

This option will provide a standard ion balance specifications file that you can modify to create a custom ion balance specifications file, because both types of files use the identical format. It can also serve as a reference for the ion balance calculations within QWDATA. You may use the first line of the specifications file for a user-specified title for the output. You may also insert comments into any part of the file by entering a “#” in column 1 of the comment line. You have full control over how the custom ion balance table is calculated, including the precedence order in which parameters are used in the calculation. For example, if multiple parameter codes for chloride are included in the file, you must specify which codes should be used. A detailed description of the specifications file is in [Appendix C](#).

### 3.3.6.2 Create or Edit Custom Ion Balance Specification File

This option will allow you to create a new Ion Balance Specification File or edit an existing file.

<b>Do you wish to:</b>
<b>1. Create new file</b>
<b>2. Edit an existing file</b>
Please enter selection (1,2,q, <CR>=2): _

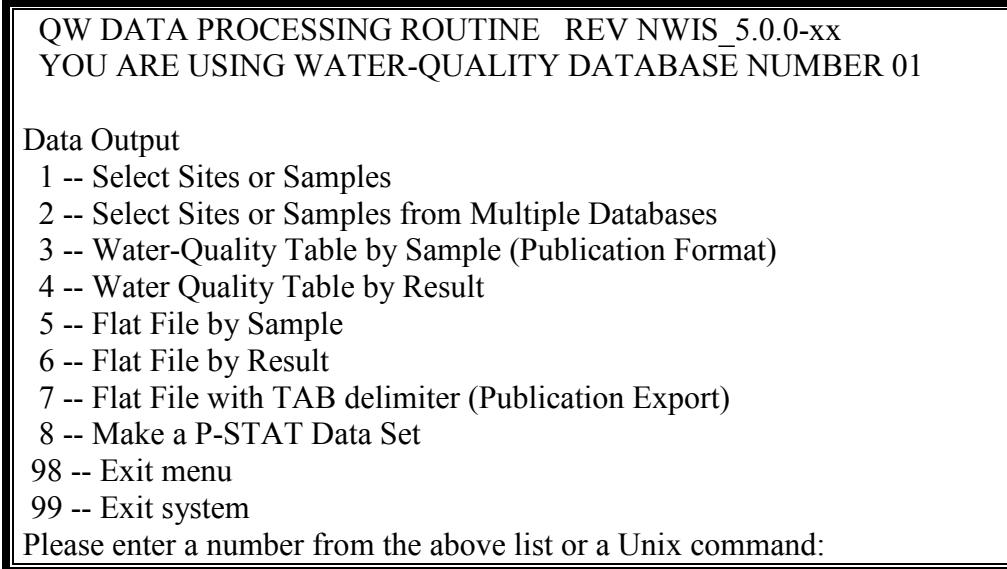

To create a new file, the following screen will appear.

<b>qwioneditspec</b>							
<b>Custom Ion Balance Specifications</b>							
<b>Page 1 of 1</b>							
<b>PCode</b>	<b>Ion</b>	<b>Group</b>	<b>MEQ</b>	<b>Calc Factor</b>	<b>Major Flag</b>	<b>Row ION</b>	<b>Cation No /Anion</b>
1: _____ - - - -							
Options: # /x/+x/-x/p/n/d/a/c/q							

To begin, enter “/a” to add the first ion. For specific details about each of the columns in this screen, review the Ion Balance Specifications File (tab-delimited) output in [Appendix C](#). To add more ions/lines to any screen, move the cursor to an existing line and use the “/a” option to add another line. If a parameter code is entered for an ion that is used in the standard ion balance table, then the program will automatically provide the “Ion,” “MEQ Factor,” “Calc Flag,” “Major ION,” “Row No,” and “Cation/Anion” codes. These values may be accepted or changed. To edit an existing ion balance specification file, use Option 2 “Edit an existing file” and provide a filename. The contents of the ion balance specifications file will be displayed to the screen—first the ions may be edited and then the title may be edited. Ion entries can be inserted, modified, or deleted.

### 3.4 Option 4 – Data Output

Option 4 of the main menu accesses a submenu with options to output data (1) in tables for publication in reports, (2) in files that can be loaded into other applications, and (3) in files that can be used for the P-STAT statistical package. Tables for publication and files that can be loaded into other applications can be retrieved in two formats: by sample or by result. Additional information about tabling options can be found in [Section 2 –Getting Started](#). To retrieve any of these output formats, a file of record numbers is required, and it can be produced using Option 1 or 2 from the Data Output menu.

**Data Output Options**

### 3.4.1 Option 1 – Select Sites or Samples

*[See description in Section 3.3.1.](#)*

### 3.4.2 Option 2 – Select Sites or Samples from Multiple Databases

*[See description in Section 3.3.2.](#)*

### 3.4.3 Option 3 – Water-Quality Table by Sample (Publication Format)

This option was used to prepare tables of water-quality data in the historical format required by the USGS for publication in the Water Science Center (WSC) Annual Data Report (ADR).

Output for the ADR is now produced using Option 7 –Flat File with TAB delimiter (Publication Export), [Section 3.4.7](#). The four table types described below are available with Option 3 as well as with Option 4 – “Water Quality Table by Result.”

1. **Single-station format:** Data for each station are tabled separately so that each new station starts at the top of a page. Currently this is the only format for surface water-quality data published with streamflow gage record in the WSC ADR.
2. **Miscellaneous-station format:** Data for all stations are tabled together. Each new set of parameters begins at the top of a page. Station numbers, names, and latitude/longitude are printed on a single line that precedes the data for that station. This is the most commonly used format for publishing miscellaneous records of surface-water quality.
3. **Multiple-station format:** Data for all stations are tabled together in sequence just as for the miscellaneous-station format. Station numbers and dates, if requested, are printed in the first columns of the table. This is the most commonly used format for miscellaneous groundwater data.
4. **Biologic data format:** Data for each station are tabled separately so that each new station starts at the top of a page. For each sample, the output tabulates the taxonomic biological identification, counts, and percentage of population. This format was developed for and used to display data produced during the 1970s and early 1980s by the biologic section of the Atlanta Central Laboratory.

#### 3.4.3.1 Specify the Sample Records for Tabling

After selecting Option 3, you will be asked to provide the name of the file that contains the list of record numbers to be tabled. This list is usually generated by the “Select Sites or Samples” ([Section 3.3.1](#)) option or the “Select Sites or Samples from multiple databases” ([Section 3.4.2](#)) option. A list also may be created by using an editor; the format for this type of input file is shown in [Appendix G](#). Beginning in column 1, enter each eight-digit record number on a separate line. If the records are from multiple databases, the database number is a two-digit number in columns 9–10. After identifying and opening the input file, provide the name of a file that will contain the output table. If the specified output file already exists, you may replace the data in the file (overwrite), leave the file intact and add the new table to the end of the file (append), or type in a new filename.

Enter name of file to hold output –  
: std.table  
That file already exists  
Do you wish to re-use that file (Y/N)? y  
Do you wish to over-write or append (O/A)?

**You will be prompted to provide the name of a file that will contain the output table.**

### 3.4.3.2 Specify the Table Definition

Assemble a “table definition” by selecting a table type and specifying output options. The table definition sets up the specification parameters that determine the table format. Enter the table definition either from an existing table definition file or by answering several queries. If you enter “Yes,” you are prompted to enter the file pathname. If the specified table definition file exists, the table definition is retrieved and displayed. You will be asked if this is the desired definition and, if so, if are changes to be made to the definition.

If no existing definition is to be used, the following screen is displayed:

**TABLE TYPE (1,2,3,OR 4):**  
**DELETE COLUMN IF NO DATA (Y OR N): Y PRINT PARAMETER CODES (Y OR N): Y**  
**LINES PER PAGE: 90 FOLDING OPTIONS (0,1,2,OR 3): \_**  
**REMOVE HEADING LINE (Y OR N): N**

**Table definition screen allows you to select from formatting options for tables output in publication format.**

If you are uncertain about the meaning of a field on the screen, entering a question mark (?) will produce an explanation of the field and the effect of each option to be displayed; the cursor then returns to the same field for entry of the option value.

**TABLE FORMAT (MANDATORY):****OPTIONS:**

- 1 -- Single Station.**
- 2 -- Miscellaneous Station.**
- 3 -- Multiple-Station.**
- 4 -- Biologic Data.**

PLEASE ENTER 1, 2, 3, OR 4:

**When a "?" is entered in the table type field, a list of field options is displayed to the screen.**

After you enter the table type code, default options are placed after the colon (:) in each succeeding field. Enter a carriage return to accept the default value.

- **TABLE TYPE (1,2,3, OR 4)** : Examples of each table type are found in [Appendix C](#).
- **DELETE COLUMN IF NO DATA (Y OR N)**: Y If none of the selected samples contain a result for one of the requested parameters, the columns associated with that parameter will be removed entirely unless you enter an “N” here. In that case, the column headings will be retained and the no-value indicator of “—“will be printed for each analysis.
- **PRINT PARAMETER CODES (Y OR N)**: Y Parameter codes will be included with the parameter name in the column headings unless you enter an “N.”
- **LINES PER PAGE: 90** This determines the number of lines printed per page of output. The default page length of 90 lines produces a page with the proper proportions for reduction to the standard WSC ADR page size. To modify the 90 lines per page, enter the appropriate number of lines, left justified.
- **FOLDING OPTIONS (0,1,2,OR 3)**
  - 0 No folding, applicable to all table types
  - 1 Horizontal folding, 24–100 parameters per page, applicable to type 1 tables only
  - 2 Horizontal folding (obsolete, same as Option 1)
  - 3 Vertical folding, maximum of five parameters (including date), applicable to type 1 and type 2 tables only
- **REMOVE HEADING LINE (Y or N)**: N The top line of the table will include a heading line with the WSC code, “**United States Department of Interior - Geological Survey,**” and processing date unless a “Y” is entered here.

Each table type results in a different list of formatting options. Additional fields may appear as options, depending on the table type selected.

If you select table type 1 (single-station format), two additional fields, **REPORTING YEAR** and **TABLE TITLE** are added to the screen.

- **REPORTING YEAR** (W=WATER,C=CALENDAR,BLANK=NO BREAK): Allows you to specify if pages should break with new headings or be suppressed at changes in the water year or calendar year. A <CR> enters the default (blank) and suppresses a page break.
- **TABLE TITLE**: Allows you to select any of the following 13 standard titles to be placed on each page of the table.

Table Title Selections	Title Text
0	<b>WATER-QUALITY DATA</b>
1	<b>CHEMICAL ANALYSES</b>
2	<b>PARTICLE-SIZE DISTRIBUTION OF SUSPENDED SEDIMENT</b>
3	<b>PARTICLE-SIZE DISTRIBUTION OF SURFACE BED MATERIAL</b>
4	<b>SUSPENDED SEDIMENT DISCHARGE</b>
5	<b>SPECTROGRAPHIC ANALYSES</b>
6	<b>RADIOCHEMICAL ANALYSES</b>
7	<b>PESTICIDE ANALYSES</b>
8	<b>WATER LEVEL, IN FEET, BELOW LAND-SURFACE DATUM</b>
9	<b>ELEVATION IN FEET, NGVD</b>
A	<b>WATER LEVEL, IN FEET ABOVE OR BELOW LAND-SURFACE DATUM</b>
X	<b>CROSS SECTION ANALYSES</b>
Z	<b>ENTER YOUR OWN HEADING (80 CHARACTERS MAXIMUM)</b>

**Table titles that may be selected for publication-style tables.**

Selection “Z” allows you to supply any title text up to 80 characters. When you select “Z”, “**TITLE:**” is displayed, and you can enter the desired text.

After the table definition has been defined for table type 1, processing passes to the next step—storing the table definition.

When you select table type 2 (miscellaneous-station format), available fields are the same as for a type 1 table, and processing passes to the next step of storing the table definition.

When you select table type 3 (multiple-station format), seven additional fields are added to the table definition screen shown for a type 1 and type 2 table.

- **COUNTY SKIP OPTION:**

- **COUNTY SKIP OPTION:**
  - 0 No skip; table is not sorted by county (default).
  - L Sort by county; place three blank lines between counties; do not print county name.
  - P Sort by county; place a page break between counties; do not print county name.
  - Q Sort by county; place three blank lines between counties; print county name.
  - R Sort by county; place a page break between counties; print county name.

**NOTE:** *The alpha parameter code “CNTYC” must be included in the parameter list to use this option. If CNTYC is the last parameter in the list, county codes are used but not included in the table. If one of the skip options is invoked and CNTYC is not in the parameter list, it is added as the last parameter in the parameter code list.*

- **LEFT-ADJUST LOCAL ID (Y OR N): N** This is applicable only if you include the alpha parameter LOCAL in the parameter list; the local identifier (usually the well number) may be left justified under the column heading (Y) or printed verbatim with any blanks that may be included in the SITEFILE retained (N).
- **PRINT DATES (Y OR N): Y** A column containing sample dates is printed unless you enter “N.” If the alpha parameter DATES is not included in the parameter list, it is added automatically after the last alpha parameter. If you select Option 1 for “Data for continuing pages,” this setting will be ignored.
- **CENTER STATION ID (Y OR N): N** This option affects the alpha parameters STAID (station identification number) and “SNAME” (station name). These values may be centered under their column headings (Y) or printed exactly as they are found in the SITEFILE, retaining any blanks (N).
- **REPEAT DUPLICATE ID'S (Y OR N): N** Values for sample identifiers STAID (station identification number), LOCAL (local station identifier), and/or LATLG (latitude-longitude) are printed for only the first line in a group of samples with the same ID. Samples must be sorted on one of these fields. These values may be printed for every sample by entering “Y.”
- **SKIP A LINE ON CHANGE OF STATION (Y OR N): N** A blank line is inserted between every five analyses, regardless of station number. Enter “Y” to also insert a blank line between each new station number. This option is valid only if the record numbers are sorted by the alpha parameter STAID (station identification number).

- **DATA FOR CONTINUING PAGES:** When the number of parameters selected for tabling requires more than one page per sample, you can specify which identifier will be used on the continuation pages. The nine available options are shown below.

Selection	Description
1	<b>Date (default)</b> <b>Note: If this is chosen, the option for “Print Dates” is overridden</b>
2	<b>Station number</b>
3	<b>Station name</b>
4	<b>Local well number</b>
5	<b>Latitude and longitude</b>
6	<b>Station number and date</b>
7	<b>Local well number and date</b>
8	<b>Database number</b>
9	<b>Medium code</b>

**Available selections for identifying samples on  
continuation pages in multiple-station format tables.**

After the table definition has been constructed for table type 3, processing passes to the next step of storing the table definition.

When table type 4 is selected, four changes are made to the basic menu.

- DELETE LINE replaces DELETE COLUMN.
- PRINT PARAMETER CODES (Y OR N): Y You do not have the option of making a selection.
- FOLDING OPTIONS (0,1,2, OR 3) You do not have the option of making a selection.
- TABLE TITLE: 0 You may select one of the four table title selections shown below. Selecting “Z” allows you to supply any title text up to 80 characters. When you select “Z”, “**TITLE:**” is displayed, and you can enter the desired text.

Table Title Selection	Title Text
B	<b>BENTHIC INVERTEBRATE ANALYSES</b>
C	<b>PHYTOPLANKTON ANALYSES</b>
D	<b>PERIPHYTON ANALYSES</b>
Z	<b>Enter the heading text (80 characters maximum)</b>

**Table titles that may be specified for biologic-style tables.**

After the table definition for table type 1, 2, 3, or 4 is completed, you may make changes to the definition. To do so, position the cursor on the first field after “TABLE TYPE.” You may enter a <CR> in fields that do not need to be changed and may retype the entry for fields that do need to be changed. This loop is continued until you are satisfied with the table definition and respond with a “No” or “N” when prompted to change the table definition. You may save the table definition for reuse on another table retrieval.

### 3.4.3.3 Specify Parameter Codes for Tabling

Parameter codes for output may be input from a file of parameter codes in a specific format [Appendix G](#), or may be entered interactively. A maximum of 1,000 parameters may be included in a table. The number of requested parameters may need to be reduced slightly when required parameters are automatically included by the tabling software and the 1,000 parameter code limit is exceeded. For single-station format only, composites that span the end of a month are permitted and are printed with the proper dates.

Next you are prompted to enter parameter codes for tabling.

Select one of the following options to identify the columns in the table (parameter codes are used to identify columns):

- 1 -- Enter parameter codes at the terminal
- 2 -- Enter a filename that contains a list of parameter codes

Enter option desired (1-2, or Q to quit):

If parameter codes are entered from the terminal, the following prompt appears.

Enter up to 1000 parameter codes:

(1) P: 00400

(2) P: \_\_\_\_\_

Options: ? ^D # / /x /+x /-x /@ /c /q -- Enter ?/ for help

The next prompt is given the sequence number 2 and so forth until interactive entry is ended. End interactive parameter code entry by entering a carriage return <CR> for a parameter code. When interactive entry of parameter codes is completed, you are given the opportunity to make changes to any entry by entering the sequence number of the parameter code to be changed. Parameter codes are checked against the parameter code dictionary so that invalid parameter codes are rejected upon entry. If parameter codes **81024 (drainage area), 72000 (datum), or 72008 (well depth)** are included in the list of parameters and are not present in the water-quality record, they will be retrieved from the SITEFILE record. All numeric parameters contained in the parameter code dictionary are supported. Alpha parameter codes also may be tabled. A complete list of alpha parameter codes is available in [Appendix A](#).

During interactive session, a question mark entered for a parameter code allows you to display and search among all parameter codes with the same initial two digits, or to display the alpha parameter codes. If you enter a question mark, the software displays the following message.

Need to qualify. Enter at least 2 lead chars of code (A for alpha parms):

Below are characteristics to remember about parameters used in publication table format.

- Parameters are placed in the table in publication order unless you choose to place them in the order they are supplied. If you select only one parameter to be included in the table, there is no option to place the parameters in publication order.
- When the alpha parameter CALCV (include all possible calculated parameters) is specified in a by-sample format, all calculated parameters whose Group code identifies this subset ([Section 3.6.7.2](#)) are inserted at the point where the CALCV parameter was listed in ascending numeric order.
- When the alpha parameter ADDPC is specified, all *numeric* parameters (including calculated parameters that have stored values) are printed in ascending numeric order.
- When the alpha parameter ALPHA is specified, all possible *alphabetic* parameters are inserted at the point where indicated, and sorted alphabetically. See [Appendix A](#) for the few parameters not included; among them are ADDPC and CALCV.

- A maximum of 1,000 parameters may be included in a single table; the number of parameters may be reduced slightly when required parameters are automatically included by the tabling software.
- If an invalid numeric parameter is requested, an error message is written and the requested parameter is ignored.
- Date printing may be suppressed *only* for type 3 tables. If the alpha parameter DATES is not in the parameter list, it is automatically inserted as the first parameter.
- The vertical folding option is limited to five parameters (including DATES). If more than five parameters are listed when the vertical folding option has been specified, you will receive an error message and a parameter count. Parameters must be reentered from the terminal or reread from a file.
- Multiple occurrences of the same parameter are not permitted. If a parameter is entered more than once, the first occurrence is retained and the others are deleted from the list.
- When tabling records from multiple databases, the parameters MEDIM and DBNUM will be appended if not requested, for Output tables 3 and 4, Publication Styles only.
- Parameters other than *biological (taxonomic)* parameters, and medium codes other than **BH**, **BY**, **BE**, **BI**, and **BD** will be omitted by the program for table type 4.

### 3.4.3.4 Water Quality Table Options

Several options are available for formatting standard water-quality tables, and they can be specified from the following menu.

( 1 ) Limit Results by DQI Code:	<input checked="" type="checkbox"/> <b>X_Public accessible [ASR]</b> <input type="checkbox"/> User Specified
( 2 ) Parameter Order:	<input checked="" type="checkbox"/> <b>X_Publication Order</b> <input type="checkbox"/> As Supplied
( 3 ) Rounding of Result Values:	<input type="checkbox"/> None <input type="checkbox"/> User <b>X_Default</b>
( 4 ) Censoring of Zero Values:	<input checked="" type="checkbox"/> <b>X_None</b> <input type="checkbox"/> User Specified
( 5 ) Recensoring of Values:	<input checked="" type="checkbox"/> <b>X_None</b> <input type="checkbox"/> User Specified
( 6 ) Qualifiers in Output:	<input type="checkbox"/> Yes <b>X_No</b>
( 7 ) Footnotes:	<input type="checkbox"/> None <b>X_Remarks</b> <input type="checkbox"/> Qualifiers
( 8 ) Create Parnames File:	<input type="checkbox"/> Yes <b>X_No</b>
( 9 ) Time Datum:	<input checked="" type="checkbox"/> <b>X_Watch</b> <input type="checkbox"/> User Specified
(10) Restrict parameters:	<input type="checkbox"/> None <b>X_Public</b>
(11) Display text for fixed values:	<input type="checkbox"/> Yes <b>X_No</b>
(12) Calculated-value precedence:	<b>X_Stored, calculated</b> <input type="checkbox"/> User Specified

Enter item to change (1-12) or <CR> to continue:

**Screen with default specifications for specifying how parameter results will be printed in a table.**

The default specifications are marked with an X as shown on the above screen. You can accept the default specifications by entering a <CR>. You can change each option by entering numbers 1–12 to access one of the submenus described below.

#### 1. Limit Results by DQI Code:

This allows you to specify results that will be tabled according to the data quality indicator (DQI) associated with each result. By default, only results that are publicly accessible, or marked as historical, presumed satisfactory, or reviewed and accepted [DQI codes A, S, or R] will be tabled. By changing the default option, you may choose to include data that are in review, are reviewed and rejected, are from an unapproved laboratory or method, or are proprietary. Data that are marked proprietary shall not be published or made available to the public. If rejected results (DQI = Q or X) are included in water-quality table output, a “#” symbol will be included after (or behind) the value to indicate that the result has been rejected.

*NOTE: If calculated values are included in the output, the DQI associated with the calculated value will be determined by the DQI's of the parameters used in the calculation (Appendix D). The DQI for the calculated value will be applied from left to right in the following list:*

**X P O U Q I S A R**

For example, if the parameters used in the calculated value had DQIs of P, S, and R, the calculated value would have a DQI of P applied at output.

*NOTE: If results have DQI codes that indicate they are proprietary (P, O, X) or that they are awaiting review or from unapproved methods (I or U), the results may not be available for retrieval by all users. Only users with certain access will be able to retrieve results with these DQI codes.*

**qwtable -- select result inclusion by DQI**

**The following categories are available:**

**A – Historical**

**S -- Presumed satisfactory**

**R -- Reviewed and accepted**

**Q -- Reviewed and rejected**

**I -- In review**

**U -- Unapproved method**

**P -- Proprietary, unreviewed**

**O -- Proprietary and approved**

**X -- Proprietary and rejected**

**Enter ‘all’ or letters for categories desired, no space between:**

## **2. Parameter Order:**

Allows you to specify if data will be tabled in approved USGS publication order or in the order specified by the user on input.

**qwtable -- select constituent ordering**

**Do you want numeric parameters in “publication” order (Y/N,  
<CR>=Y)?**

*NOTE: If alpha parameter codes are included in the list of parameters to be included in the output and publication ordering is selected, the parameters will not be included in publication order. To include alpha parameter codes with publication ordering, include the alpha parameter codes at the beginning of the parameter list.*

### 3. Rounding of Result Values:

```
qwtable -- select rounding  
You have 3 options for rounding of parameter values--  
D --Default, use default rounding  
U --User, use rounding stored with parameter  
N -- None, output analysis value as stored  
Enter option desired (<CR>=D):
```

**Default rounding (D)** produces tables with each parameter value rounded using the rounding instructions array in the parameter-method table. A discussion of the rounding is included in the [“Programs” section, “Support Files” \(Section 3.6.8\)](#) and in [Tip Sheet 5.19, “How can I round my results in QWDATA output.”](#) The precision of results is based on an analysis of the variability of replicate measurements. Lacking such an analysis, you should select the “**Default**” rounding when preparing tables of water-quality data for publication. The “**Default**” rounding is based on laboratory analysis of the most precise method currently available and uses precision data stored in the parameter-method table.

**User-defined rounding (U)** produces tables with each parameter value rounded using the rounding instruction stored with the analysis at the result level. If this option is selected, and the rounding code is not stored with a sample, the software will use the rounding code stored in the parameter-method table.

**No rounding (N)** produces tables in which each parameter is written as entered in the database. Calculated results ([Section 2.6.1](#)) are written with one more significant digit than would be produced if the result were rounded.

**Note: Due to a nine-character field width restriction, the program is unable to display values with nine or more digits.**

### 4. Censoring of Zero Values:

Selecting to censor zero values makes available three other options. **Option 1** is the default—zero values are not censored. **Option 2** allows you to censor stored zero-value measurements based on a reference list ([Appendix I](#)); zero values will be converted to a null value and the remark code will be changed to **U** (Analyzed for, but not detected) for parameters in this list. **Option 3** allows you to enter parameter codes and values interactively, so that each parameter code and value pair can be set individually. **Option 4** allows you to enter a file that contains individual parameter code and value pairs; the file must be in fixed-column format ([Appendix G](#)).

The reference list ([Appendix I](#)) will also be applied to censor parameters not entered interactively or from a file. **Note: this option does not apply to fixed-value parameter codes, where an integer is coded in place of a text explanation.**

```
qwtable -- set up user censoring of stored zero values
You have 4 options:
1 -- no censoring of zero values
2 -- censor by reference list only
3 -- specify parameter code & value for selected parameters at the terminal
4 -- load a set of parameter codes with value from a file
```

Enter option desired (1-4, <CR>=1):

## 5. Recensoring of Values:

By selecting Option 5, six options are available for censoring data at a new censoring level (recensoring). Recensoring does not change anything stored in the database. In output tables, however, any stored values less than the recensoring value are displayed as recensored values and qualified with a “<” (less than) remark code. Recensoring may be useful for focusing the data user’s attention on the higher data values and away from visual differences that are not relevant to understanding environmental processes. **Note: this option does not apply to fixed-value parameter codes, where an integer is coded in place of a text explanation.**

```
qwtable -- set up user re-censoring
You have 6 options for recensoring of constituents:
1 -- No recensoring
2 -- Recensor all constituents to a specified value
3 -- Recensor each constituent to the highest associated reporting level
      stored for the constituent-method
4 -- Recensor values for specified parameters and methods
5 -- Recensor each value that is below the associated reporting level
6 -- Recensor each constituent to the highest censored level

Enter recensor option desired (1-6, <CR>=1):
```

**Option 1 (default selection)** includes results in output as they are stored in the database. Results in the database are censored by the laboratory at a specified reporting level. This reporting level varies depending on the constituent and the analytical method. In addition, the reporting level can change over time due to the conditions under which the sample is analyzed or the chemical characteristics of the sample.

**Option 2** allows you to recensor all constituents in the data output to user-specified value. The output will display all results that are below the selected recensoring level as less than the recensored value chosen. This option would most likely be used for comparisons among constituents, methods, and (or) laboratories.

In the example below, the user has chosen a recensoring level = 10. The values in bold have been recensored for output.

Parameter code	Stored value	Output
01020	2	<10
01046	3	<10
00915	10	10
00930	15	15
00940	22	22

In the example below, the user has chosen a recensoring level = 0.1. The values in bold have been recensored for output.

Parameter code	Stored value	Output
46342	<0.05	<0.1
77825	<0.1	<0.1
46342	0.1	0.1

**Option 3** allows you to recensor all constituents to the highest stored associated reporting level for each unique constituent-method combination. This option references only those results in the selected records. If none of the measurements for a constituent-method combination are associated with a stored reporting level (e.g., data stored prior to NWIS 4\_1 or transmitted by a laboratory with no reporting level), then no recensoring is performed on those results.

In the example below, parameter codes 01046(G0052), 46342(GC058), 77825(GC098), and 46342(GC065) have stored reporting levels, and the highest for each constituent-method combination is used to censor results in the output. The values in bold have been recensored for output.

Parameter code	Method code	Reporting level	Stored value	Output
01046	G0052	5	<b>2</b>	<5
01046	G0052	4	<b>3</b>	<5
01046	G0052		22	22
01046	G0051		3	3
01046	G0051		10	10
01046			15	15
46342	GC058	0.05	<0.05	<0.05
46342	GC058	0.05	E0.06	E0.06
46342	GC058	0.05	0.19	0.19
46342	GC065	0.06	<0.08	<0.08
46342	GC065	0.06	E0.05	<b>&lt;0.06</b>
46342	GC065	0.06	0.21	0.21
77825	GC098	0.1	<0.1	<0.1
77825	GC098	0.1	V0.15	V0.15
77825	GC098	0.1	0.2	0.2

**Option 4** allows you to specify a new censoring level for each constituent-method combination. You may do this interactively by entering the parameter code, method code, and recensoring value at the terminal or by using an input file. The input file must use the fixed-column format shown in [Appendix G](#). This technique would most likely be used for spatial or trend analysis without regarding effects from compound interferences or changes in laboratory performance. This option provides the maximum amount of control over recensoring. Constituents not specifically identified in the user-specified recensoring limits will not be recensored.

In the example below, the user has entered the following measurement-specific recensoring levels: 01046(G0051) = 5; 46342(GC058) = none; 77825(GC098) = 0.2; 46342(GC065) = 0.15. The values in bold have been recensored for output.

Parameter code	Method code	Stored value	Output
01046	G0052	2	2
01046	G0052	3	3
01046	G0052	22	22
01046	G0051	3	<5
01046	G0051	10	10
01046		15	15
46342	GC058	<0.05	<0.05
46342	GC058	E0.06	E0.06
46342	GC058	0.19	0.19
77825	GC098	<0.1	<0.2
77825	GC098	V0.15	<b>V0.2</b>
77825	GC098	0.2	0.2
46342	GC065	<0.08	<0.15
46342	GC065	E0.05	<b>&lt;0.15</b>
46342	GC065	0.21	0.21

**Option 5** allows you to censor each result that is below the associated reporting level for that result. The most common application of this option is to remove the results coded with an “E” remark code that identifies results below the reporting level. This technique would be used to reduce the probability of false positive detections in the data reporting. If no reporting level is stored with the result, then no recensoring is performed on the value.

In the example below, reporting levels for 01046(G0052) and 46342(GC065) affect the output of result values. The values in bold have been recensored for output.

Parameter code	Method code	Reporting level	Stored value	Output
01046	G0052	5	2	<5
01046	G0052	4	3	<4
01046	G0051		3	3
01046	G0051		10	10
01046			15	15
01046	G0052		22	22
46342	GC058	0.05	<0.05	<0.05
46342	GC058	0.05	E0.06	E0.06
46342	GC058	0.05	0.19	0.19
77825	GC098	0.1	<0.1	<0.1
77825	GC098	0.1	V0.15	V0.15
77825	GC098	0.1	0.2	0.2
46342	GC065	0.06	<0.08	<0.08
46342	GC065	0.06	E0.05	<0.06
46342	GC065	0.06	0.21	0.21

**Option 6** allows you to recensor by using the highest censored value for each constituent. This option references only those results in the selected record. The associated method code is not considered.

Parameter code	Method code	Stored value	Output
34653		<0.021	<b>&lt;0.03</b>
34653		E0.003	<b>&lt;0.03</b>
34653	GC065	E0.021	<b>&lt;0.03</b>
34653	GC065	0.4	0.4
34653		<0.03	<0.03
34653	GC066	0.05	0.05
46342	GC058	<0.05	<b>&lt;0.08</b>
46342	G0052	E0.06	<b>&lt;0.08</b>
46342	G0052	0.19	0.19
46342	GC065	<0.08	<0.08
46342	GC065	E0.05	<b>&lt;0.08</b>
46342	GC065	0.21	0.21
77825	GC098	<0.1	<0.1
77825	GC098	V0.15	V0.15
77825	GC098	0.2	0.2

## 6. Qualifiers in Output:

**qwtable -- select value qualifier inclusion  
Do you want to include value qualifiers (Y/N, <CR>=Y)?**

*Value qualifiers* are codes used to provide additional information about the value reported by the laboratory. You may select to add or remove footnotes for remark codes and value qualifier codes with this option. The default for this option does not include value qualifiers in the table; however, they may be included if you specify them here.

## 7. Footnotes:

**qwtable – select footnote inclusion**

**Do you want to create footnotes for remark codes (Y/N, <CR>=Y)?**

**Do you want to create footnotes for value qualifiers (Y/N, <CR>=Y)?**

The default option will include only footnotes that define any remark codes that appear in the table.

## 8. Create a Parnames File:

**qwtable – select parnames file creation**

**Do you want to create a parnames file (Y/N, <CR>=Y)?**

A parnames file contains a listing of the parameter codes and names included in the output for the current retrieval. The name of the file will be the output file name.*parnames*. This file can be used as input for parameter names for another retrieval.

## 9. Time Datum:

**qwtable -- select output time datum**

**Such as:**

**GMT AST EST CST MST PST AKST HST  
BST ADT EDT CDT MDT PDT AKDT HDT**

**Enter the acronym of the time-datum desired  
(<CR>=watch time):**

This option allows for times in the output file to appear in any time datum chosen. The default option is to display the times using the watch time ([Section](#) 2.1.9), which is equivalent to the time datum entered during login of the sample.

***NOTE: Time datum will appear in output for a sample if the time-datum reliability code is “K”; otherwise it will be blank in output unless the alpha parameter for time datum is specifically requested in the list of parameters.***

## 10. Restrict parameters:

```
qwtable -- select publicly accessible parms  
Do you want to limit parameters to publicly accessible  
(Y/N,<CR>=Y)?
```

The default option will include only parameters accessible to the public (public retrieval flag = “Y”). If you select “**None**,” the retrieval will include parameters that are not accessible to the public (public retrieval flag = “N”).

## 11. Display text for fixed values:

```
qwtable -- select fixed value display  
Do you want to display text for fixed values (Y/N, <CR>=Y)?
```

If you select the default option, text will not be included in the table for fixed values.

## 12. Calculated-value precedence:

The following options will enable you to output values from the set of calculated parameters ([Section 3.6.7](#), [Appendix D](#)) that may have stored values in the database or would have been computed by an algorithm. Remember that including the parameter CALC in the by-sample layout will also impact this option. An example would be requesting CALC with Option 3 below. That specific combination would be a “shortcut” to output all stored values from the algorithm list, without also including all numeric parameters with ADDPC.

```
qwtable -- select precedence for calculated parameters  
The following precedences are available:  
1 -- stored if available, otherwise calculated  
2 -- Calculated if possible, otherwise stored  
3 -- Only stored, never calculated  
4 -- Only calculated, never stored  
Enter option desired (1-4,<CR>=1):
```

### 3.4.3.5 Table Processing

After you are satisfied with the selections for tabling, enter a <CR> to process the table. A list of the requested parameter codes, the total number of parameter codes, the database being accessed, and the number of records retrieved are displayed.

```
Checking (037) 01090 ...
Checking (038) 38260 ...
Checking (039) 80154 ...
Checking (040) 00063 ...
Checking (041) 50280 ...
Checking (042) 72104 ...
Checking (043) 72105 ...
Checking (044) 71999 ...
Checking (045) 84164 ...
Checking (046) 82398 ...
```

**46 parameters loaded.**

**Output specifications complete, retrieving data ...**

**Retrieving from database 01 ...**

**17 records retrieved**

**Retrieval completed, formatting output...**

**Output is in the file: output**

**Do you wish to run again (Y/N, <CR>=N)?**

**Table processing display screen**

When processing has completed, the output filename is displayed, and you may repeat the steps described above for developing a [Water-Quality Table by Sample](#) table or return to the [Option 4 – Data Output](#) menu. A user's access rights may influence which sites, samples, or results are able to be output into a table, even if identified during input with proper record numbers. Some of the onscreen system messages may display information about excluded results that will not pertain; for example, to a read-only user.

### 3.4.4 Option 4 – Water Quality Table by Result

This option produces a table of result-level data in columnar format. Each water-quality parameter for a particular sample is listed on a separate row, and result-level codes are listed in columns across the row. [Appendix C](#) has an example of this output.

Upon invoking this option, you will be prompted to enter the name of the file containing record numbers and the name of an output file to which the table will be written. After entering these filenames, enter the table definition. These queries are described in detail in [Section 3.4.3.1](#) and [Section 3.4.3.2](#). **Note: This option cannot be used to make a type 4 – Biological table.**

#### 3.4.4.1 Specifying the Result-Level Parameter Codes

Next enter alpha (sample and result-level) parameter codes, which will comprise the table columns. You may enter these codes interactively from the terminal or from an existing file that contains parameter codes in fixed-column format. All valid sample and result-level alpha codes ([Appendix A](#)) and the code ALPHA, which brings in nearly all alpha codes, are acceptable entries. If you do not enter ALPHA, you must enter the alpha code PCODE so that parameter codes are printed. The parameter code REMRK is not normally included in the parameter code list. Remark codes will be automatically embedded in the output with the VALUE column. If the parameter code long name PLNAM is included in the list for output, the field will be restricted to 54 characters in the table.

Select one of the following options to identify the columns in the table

(alpha codes are used to identify columns):

- 1 -- Enter alpha codes at the terminal
- 2 -- Enter a filename that contains a list of alpha codes

Enter option desired (1-2, or Q to quit): 1

Enter alpha parameter codes (include “PCODE” for parameter numbers):

- (1) P: PCODE
- (2) P: VALUE
- (3) P: DQIND
- (4) P: \_\_\_\_\_

After you have entered the parameter codes, they are checked against the parameter code dictionary to make sure that they are valid codes. During interactive input, parameter codes are checked before the next entry, and invalid entries must be reentered.

### 3.4.4.2 Specify Table Options

After you have designated the record numbers, output filename, and result-level parameter codes, a tabling specification screen appears:

( 1) Limit results by DQI Codes:	<b>X_P</b> ublic <b>a</b> ccessible [ASR] <input type="checkbox"/> User Specified
( 2) Rounding of Result Values:	<input type="checkbox"/> None <input type="checkbox"/> User <b>X_D</b> efault
( 3) Censoring of Zero Values:	<b>X_N</b> one <input type="checkbox"/> User Specified
( 4) Recensoring of Values:	<b>X_N</b> one <input type="checkbox"/> User Specified
( 5) Qualifiers in Output:	<input type="checkbox"/> Yes <b>X_N</b> o
( 6) Footnotes:	<input type="checkbox"/> None <b>X_R</b> emarks <input type="checkbox"/> Qualifiers
( 7) Select Parameters in Table:	<b>X_A</b> ll <input type="checkbox"/> User Specified
( 8) Create Parnames File:	<input type="checkbox"/> Yes <b>X_No</b>
( 9) Time Datum:	<b>X_W</b> atch <input type="checkbox"/> User Specified
(10) Restrict parameters:	<input type="checkbox"/> None <b>X_P</b> ublic
(11) Display text for fixed values:	<input type="checkbox"/> Yes <b>X_No</b>
(12) Calculated-value precedence:	<b>X_S</b> tored, <b>c</b> alculated <input type="checkbox"/> User Specified

Enter item to change (1-12) or <CR> to continue:

#### Table options available with default settings for a result-level table.

Options 1 and 8–12 are identical to those described in [Section 3.4.3.4](#). Options 2–6 on this screen correspond directly to the aforementioned section’s Options 3–7. Option 7 invokes the following submenu, which allows you to limit the by-result output. Option 1, the default, results in all parameters to be included in the output. Option 2 allows you to enter a list of the parameters from the terminal to be included in the output. Option 3 allows you to enter a filename that contains the parameter codes to be included.

qwttable -- set up to select the parameters in the table

Select one of the following options to identify the parameters in the table (numeric parameters are used to identify rows):

- 1 -- Accept all parameters available in a sample
  - 2 -- Enter parameter codes at the terminal
  - 3 -- Enter a filename that contains a list of parameter codes
- Enter option desired (1-3,<CR>=1):

### 3.4.4.3 Table Processing

After you are satisfied with the selections for tabling, enter a <CR> and the table will be processed. A list of the requested alpha parameter codes, the database number accessed, and the number of records retrieved is displayed to the screen. Numeric parameter codes are not displayed if they were specified in the output options ([Section 3.4.4.2](#)).

```
>Loading selected parameters...

19 Parameters loaded
Output specifications complete, retrieving data...
Retrieving from database 01 ...
1 records retrieved
Retrieval completed, formatting output...
Output is in the file: table
```

**Table processing display screen**

When processing is complete, the output filename is displayed, and you may repeat the steps described above for developing a “[Water-Quality Table by Result.](#)” ([Section 3.4.4](#)) table or return to the [Option 4 -- Data Output \(Section 3.4\)](#) menu.

### 3.4.5 Option 5 – Flat File by Sample

If you select this option, you can output data to an ASCII file (flat file) that may be used to enter data to another application, such as a statistics or graphics application. This option is similar to the **Water-Quality Tables by Sample (Publication Format)** option (see [Section 3.4.3](#)), except that output is in ASCII file format rather than in table format. Examples of this type of output are in [Appendix C](#).

#### 3.4.5.1 Selecting the Output Format

Six format options are available for selecting the output format: fixed-column flat files with and without method codes, tab-delimited RDB files with and without method codes, or flat files with user-specified delimiters with and without method codes.

```
qwtable -- Flat file (by sample)

You have 6 options for flatfile output:
 1 -- Fixed column flat file (qwflatout)
 2 -- Flat file with TAB delimiter (RDB format)
 3 -- Flat file with user-specified delimiter

(Following options include method code in output)
 4 -- Fixed column flat file (qwflatoutm)
 5 -- Flat file with TAB delimiter (RDB format)
 6 -- Flat file with user-specified delimiter

Enter option desired (1-6, <CR>=1):
```

If you select a fixed-column format (Option 1 or 4), data are output to equally spaced columns ([Appendix C](#)). If you choose a fixed-column format with method code included (Option 4), the method code is included adjacent to the remark code. For example, “<GC058 10.” indicates a less-than 10 value using method “GC058.” If you select delimited files (Options 2, 3, 5, or 6), you will be asked if the value and associated remark codes should be delimited. **(Note: If you select “No,” the remark code will appear as the first column in the value field (for example <0.05). For most applications, this will cause the value to be read as a character rather than as a number.)** If you select user-specified delimiter (Option 3 or 6), you will be prompted to enter the character that will be used to delimit the data. If no delimiter is entered, the default delimiter is a space.

```
qwtable --Flat file (by sample)
```

You have 6 options for flatfile output:

- 1 -- Fixed column flat file (qwflatout)
- 2 -- Flat file with TAB delimiter (RDB format)
- 3 -- Flat file with user-specified delimiter

(Following options include method code in output)

- 4 -- Fixed column flat file (qwflatoutm)
- 5 -- Flat file with TAB delimiter (RDB format)
- 6 -- Flat file with user-specified delimiter

Enter option desired (1-6, <CR>=1): 6

Enter column separator char or TAB for tab char:

Do you want remarks and values to be delimited (Y/N, <CR>=Y)? Y

### 3.4.5.2 Specifying the Retrieval Criteria

After you have selected the desired output format, you will be prompted for the pathname of the file containing the record numbers, a filename for the output file, and for parameter codes. Parameter codes may be entered interactively or from a fixed-column file. These queries are described in detail in [Section 3.4.3.1](#) through [Section 3.4.3.3](#).

### 3.4.5.3 Specify Output Options

After the parameter codes have been entered, a screen for selecting output specifications is displayed.

```
( 1) Limit results by DQI Codes: X_Public accessible [ASR] __User Specified
( 2) Parameter Order: X_Publication Order __As Supplied
( 3) Rounding of Result Values: None __User X_Default
( 4) Censoring of Zero Values: X_None __User Specified
( 5) Recensoring of Values: X_None __User Specified
( 6) Create Parnames File: __Yes X_No
( 7) Time Datum: X_Watch __User Specified
( 8) Restrict parameters: None X_Public
( 9) Display text for fixed values: Yes X_No
(10) Calculated-value precedence: X_Stored, calculated __User Specified
Enter item to change (1-10) or <CR> to continue:
```

Options 1–5 are identical to Options 1–5 described in [Section 3.4.3.4](#), and Options 6–10 are identical to Options 8–12 described in [Section 3.4.3.4](#). These output options are the same as those for tabling data by sample and are described in detail in [Section 3.4.3.4](#).

### 3.4.5.4 Output Processing

When specifications are complete, processing begins. The screen displays the parameter codes being retrieved, the number of parameter codes loaded, the database number being accessed, and the number of records retrieved. When processing has been completed, the output filename is displayed, and you may repeat the steps described above for developing a [Flat File by Sample](#) or return to the [Option 4 – Data Output](#) menu.

### 3.4.6 Option 6 – Flat File by Result

If you select this option, you will be able to output data to an ASCII file (flat file) in a columnar format that uses one row (line) for each parameter. This format may be used to enter data to another application. This option is similar to [Option 4 – “Water Quality Table by Result” \(see Section 3.4.4\)](#), except that output is in ASCII format rather than in table format. The flat-file-by-result format is intended to be used as input into other computer programs; therefore, remark codes are not embedded within the VALUE column, as is done for the publication in a by-result layout. Therefore, you should normally request both columns, REMRK and VALUE, when preparing a flat file by result.

### 3.4.6.1 Selecting the Output Format

Three formats are available for output to an ASCII file. Output may be written in fixed-column format, tab-delimited format, or with a user-specified delimiter.

```
qwtable -- Flat file (by result)
You have 3 options for flatfile output:
1 -- Fixed column flat file
2 -- Flat file with TAB delimiter (RDB format)
3 -- Flat file with user-specified delimiter
Enter option desired (1-3, <CR>=1):
```

If you select a fixed-column format, data are output to equally spaced columns ([Appendix C](#)). If you select a user-specified delimiter (Option 3), you will be prompted to enter the character that will be used to delimit the data. If you do not enter a delimiter is entered, the default delimiter is a space.

### 3.4.6.2 Specifying the Retrieval Criteria

After you have selected the desired output format you will be prompted for the pathname of the file containing the record numbers and for a filename of the output file. These queries are described in detail in [Section 3.4.3.1](#). Next you will be queried for alpha (result-level) parameter codes. Parameter codes may be entered interactively or from a file. These queries are described in detail in [Section 3.4.4.1](#).

### 3.4.6.3 Specify Output Options

When the result-level alpha parameter codes have been entered, a screen for selecting output specifications is displayed:

```
( 1) Limit results by DQI Codes:      X_Public accessible [ASR]  __User  
Specified  
( 2) Rounding of Result Values:      None  __User  X_Default  
( 3) Censoring of Zero Values:      X_None  __User Specified  
( 4) Recensoring of Values:        X_None  __User Specified  
( 5) Select Parameters in Table:    X_All  __User Specified  
( 6) Create Parnames File:        __Yes  X_No  
( 7) Time Datum:                  X_Watch  __User Specified  
( 8) Restrict parameters:         __None  X_Public  
( 9) Display text for fixed values: __Yes  X_No  
(10) Calculated-value precedence:   X_Stored, calculated __User Specified  
  
Enter item to change (1-10) or <CR> to continue:
```

These 10 output specifications are identical to Options 1–4 and 7–12 for tabling result-level data and are described in detail in [Section 3.4.4.2](#). Note: Options 5 and 6, in the corresponding menu in the tabling options, are not included on this menu.

### 3.4.6.4 Output Processing

After you are satisfied with the selections for tabling, enter a <CR>, and the table will be processed. A list of the requested alpha parameter codes, the number of alpha parameter codes, the database number accessed, and the number of records retrieved is displayed on the screen. If numeric parameter codes were specified in the output options ([Section 3.4.6.3](#)), they are not displayed.

Output is in the file: table

**Output processing display screen**

When processing has completed, the output filename is displayed and you may repeat the steps described above for developing a “[\*Flat File by Result\*](#)” – [\*Section 3.4.6\*](#) or return to the [\*Option 4 – Data Output \(Section 3.4\)\*](#) menu.

### 3.4.7 Option 7 – Flat File with TAB delimiter (Publication Export)

This option allows you to output data to an ASCII file with the TAB-character delimiting fields, which may then be used to prepare tables of water-quality data by using publication software. This option has similar features as the publication by sample ([\*Section 3.4.3\*](#)) and flat-file-by-sample ([\*Section 3.4.5\*](#)) options, but it allows further customization of column headings, page columns, and rows. The intended usage of this output format is to help meet the prepublication formatting needs.

#### 3.4.7.1 Selecting the Output Format

Because this type of table output is specific, the user has already chosen the formatting when choosing this option from the Data Output menu. This output format features RDB-style tab-delimited output. Within the results, for example, the remark code is always included with the value and is separated from the value by one space (e.g. < 0.05) ([\*Appendix C\*](#)).

#### 3.4.7.2 Specifying the Retrieval Criteria

Users will be prompted to identify samples. You may enter record numbers interactively or from a file. If the records are to be identified by record number, the format of the file is one record number per line, with the eight-digit record number beginning in column 1 of each line as shown in [\*Appendix G\*](#). If samples are to be pulled from multiple databases, such as the QC database, 10-digit record numbers can be used, where the 2-digit database number is appended to the 8-digit record number in the record number file. If record numbers are not used, the samples may be identified by logical keys ([\*Appendix G, Section 2.1.1\*](#)).

### 3.4.7.3 Specify Output Options

Parameter codes for output may be input from a file of parameter codes in a specific format ([Appendix G](#)), or may be entered interactively. When the parameter codes have been entered, a screen for selecting output specifications is displayed.

Publication Export Options:			
1. Limit results by DQI Codes: <input checked="" type="checkbox"/> Public Accessible [ASR] <input type="checkbox"/> User Specified 2. Parameter Order: <input type="checkbox"/> Publication Order <input checked="" type="checkbox"/> As Supplied 3. Rounding of Result Values: <input type="checkbox"/> None <input checked="" type="checkbox"/> User <input checked="" type="checkbox"/> Default <input type="checkbox"/> Custom (file) 4. Censoring of Zero Values: <input checked="" type="checkbox"/> None <input type="checkbox"/> User Specified 5. Recensoring of Values: <input checked="" type="checkbox"/> None <input type="checkbox"/> User Specified 6. Qualifiers in Output: <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> User Specified 7. Create Parameter File: <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No 8. Time Datum: <input type="checkbox"/> Watch <input type="checkbox"/> User Specified 9. Restrict parameters: <input type="checkbox"/> None <input checked="" type="checkbox"/> Public 10. Display fixed values text: <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No 11. Calculated-value precedence: <input type="checkbox"/> Stored, calculated <input type="checkbox"/> User Specified 12. Include parameter codes: <input type="checkbox"/> Yes <input type="checkbox"/> No 13. Delete column if no data: <input type="checkbox"/> Yes <input type="checkbox"/> No 14. Column Headings: <input type="checkbox"/> Parameter Long Name <input type="checkbox"/> Custom (file) 15. Date format: <input type="checkbox"/> MM DD YYYY <input checked="" type="checkbox"/> MM-DD-YYYY <input type="checkbox"/> MM/DD/YYYY <input type="checkbox"/> text dates 16. Title: _____			
Changes? Enter item number to change or <CR> to continue:			

The default specifications are marked with an **X** as shown on the above screen. You may accept the default specifications by entering a <CR>. Options 1–11 are generally identical to options described in [Section 3.4.3.4](#), and 3 and 6 have additional features. Each option can be changed by entering numbers 1–16 to access one of the submenus described below.

#### 1. Limit Results by DQI Code:

[Described in Section 3.4.3.4.](#)

#### 2. Parameter Order:

[Described in Section 3.4.3.4.](#)

#### 3. Rounding of Result Values:

The “None,” “User,” and “Default” options are described in [Section 3.4.3.4](#). Selecting “Custom” allows you to specify a filename that defines one of these three rounding options for specific parameter and method code pairs. The file includes parameter code, method code (optional) and a rounding code of “N” (none), “U” (user) or “D” (default). Parameters and methods without specific rounding instructions will be rounded using default rounding. The format for this file is described in [Appendix G](#).

**4. Censoring of Zero Values:**

[Described in Section 3.4.3.4.](#)

**5. Recensoring of values:**

[Described in Section 3.4.3.4.](#)

**6. Qualifiers in Output:**

You may request that all value qualifier codes are included in the output (“Yes”), no value qualifiers are included (“No”), or selected value qualifiers are included (“user specified”). If you select “user specified,” selection may be interactive or by providing a file. The input file format is described in [Appendix G](#). The onscreen dialogue will appear like this.

Do you want to enter value qualifiers from the terminal? (y,n, <CR>=y): y  
**Publication Export Options:**

**Enter Qualifier Codes:**

(1) : k

**7. Create Parameter File:**

A parameter file contains a listing of the parameter codes and parameter long names included in the output for the current retrieval. This file can be used as a parameter input file, but not for the parameter column headings.

**8. Time Datum:**

[Described in Section 3.4.3.4.](#)

**9. Restrict Parameters:**

[Described in Section 3.4.3.4.](#)

**10. Display Text for Fixed Values:**

[Described in Section 3.4.3.4.](#)

**11. Calculated-value precedence:**

[Described in Section 3.4.3.4.](#)

**12. Include Parameter Codes:**

If selected, a row will be inserted into the output file that includes the parameter code enclosed in parenthesis after the parameter name (for example “(00010)”).

**13. Delete Column if No Data:**

If none of the selected samples contain a result for one of the requested parameters, the column associated with that parameter will be removed entirely if you select “**Yes**.” If you select “**No**,” the column heading will be retained and the no-value indicator of “—” will be printed for each analysis.

#### **14. Column headings:**

For numeric parameters, the default selection will be the parameter long name. For alphabetic parameters, the parameter short name will be used; however, if you wish to customize any column headings, you must format an input file with parameter code and customized text, along with any defined terms or symbols for a table headnote. The format of the custom input file is a tab-delimited, three-column file that includes:

- parameter code (length = 5),
- parameter column heading text (maximum length = 170), and
- headnote definition (maximum length = 150).

If you include a numeric or an alphabetic parameter code in the retrieval, but the code does not have a defined name in the custom name file, then the default parameter name will be used in the column heading. Also see [Appendix G](#).

#### **15. Date Format:**

There are four options for displaying the sample dates, as shown in the menu. Three of the options list the month (MM), day (DD), and year (YYYY) in a numeric format, and one option spells out the month. For example, here are the four variations of the same date:

02 28 2010, or

02-28-2010, or

02/28/2010, or

February 28, 2010.

#### **16. Title:**

You may enter a title for the publication export file that will appear on a single row in the file. The title text may be up to 500 characters in length.

#### **3.4.8 Option 8 – Make a P-STAT Data Set**

When you choose this option, selected data from specified records may be written to a sequential file that may be read by the standard P-STAT input routines. When you choose this option, you should select “**no rounding**.” If you do not select “**no rounding**,” the data output file will contain blanks and the P-STAT software will not be able to read the file. Examples of this type of output are available in [Appendix C](#).

##### **3.4.8.1 Specifying the Retrieval and Output Criteria**

You will first be queried for the pathname of a file containing record numbers and the pathname of an output file. These queries are the same as those for the other options in “Data Output” and are described in detail in [Section 3.4.3.1](#).

After you have specified these files, you will be prompted to enter an output format option. Three options are available for handling values that include remark codes.

**qwttable -- P-stat format****p-stat output format****You have 3 options for handling remarks codes**

- 1 -- Remarks (<, ND, etc.) included with the data**
- 2 -- Remarks deleted but values retained (a remark code of “ND” or “M” will yield a value of “--”, a missing value of the first kind)**
- 3 -- Values with remarks codes set to “--”, a missing value of the second kind**

**A count of the remarked values will be provided****Enter your choice ( 1-3):**

- 1. Option 1** - Remark codes may be included with the associated values in the output file.  
**Note: This format is invalid for input to P-STAT because P-STAT cannot handle remarks in this manner; it is provided for data verification only.**
- 2. Option 2** - Remark codes may be suppressed and only the associated values are included in the output file. For a remark code of ”ND” (not detected) there is no associated value; the output file will contain “--” (defined in P-STAT as a missing value of the first kind).
- 3. Option 3** - All values associated with remark codes may be replaced with “--” (defined in P-STAT as a missing value of the second kind).

Regardless of which option you choose, a summary list of remarked values is produced in a separate output file.

Next, you will be queried for a list of parameter codes either entered interactively or from a file that contains a list of parameters ([Appendix G](#)). If the parameter list is not in a file, enter each parameter from the terminal; enter a null entry (<CR>) to end the list. Only numeric parameters and the three [alpha parameters \(Appendix A\)](#) ADDPC, CALCV, and SAMPL are valid. A maximum of 1,000 parameters may be included. These queries are described in detail in [Section 3.4.3.3](#).

### 3.4.8.2 Specify Output Options

After you have entered the parameter codes, a screen for specifying output options is displayed.

```
( 1) Limit results by DQI Codes:      X_Public accessible [ASR]  __User  
Specified  
( 2) Parameter Order:                X_Publication Order  __As Supplied  
( 3) Rounding of Result Values:    __None  __User  X_Default  
( 4) Censoring of Zero Values:     X_None  __User Specified  
( 5) Recensoring of Values:       X_None  __User Specified  
( 6) Create Parnames File:        __Yes  X_No  
( 7) Time Datum:                  X_Watch  __User Specified  
( 8) Restrict parameters:         __None  X_Public  
( 9) Display text for fixed values: __Yes  X_No  
(10) Calculated-value precedence:   X_Stored, calculated __User Specified  
  
Enter item to change (1-10) or <CR> to continue:
```

These output options are the same as those for creating a flat-file by-sample table and are described in detail in [Section 3.4.5.3](#).

### 3.4.8.3 Output Processing

After specifications are complete, processing begins. The screen displays the parameter codes being retrieved, the number of parameter codes loaded, the database number being accessed, and the number of records retrieved.

```
Checking (038) 38260 ...
Checking (039) 80154 ...
Checking (040) 00063 ...
Checking (041) 50280 ...
Checking (042) 72104 ...
Checking (043) 72105 ...
Checking (044) 71999 ...
Checking (045) 84164 ...
Checking (046) 82398 ...

46 parameters loaded.

Output specifications complete, retrieving data ...

Retrieving from database 01 ...
17 records retrieved

Retrieval completed, formatting output...

Your summary of parameters with remarks is in output.stats

Output is in the file: output

Do you wish to run again (Y/N, <CR>=N)?
```

Three output files are created. The first file contains data retrieved for each record number requested and is given the user-specified name. Each record has at least two 80-character lines. The first line for each record contains the station number, begin date, begin time, end date, and end time. If date or times are missing, as they may be for some historic samples, they are represented by “-” (defined by P-STAT as a missing value of the first kind). Each remaining line for each analysis contains a maximum of eight data values. Each value occupies nine spaces and is preceded by a blank. If there is no value for a requested parameter, the value is represented by “-” (defined by P-STAT as a missing value of the first kind). [See Section 2.7.1](#) for information on rounding.

A second output file is named by adding “.CMND” to the user-supplied filename. This file contains the P-STAT commands that are needed to identify the variables and the commands to read the data into P-STAT.

The third output file is named by adding “.STATS” to the user-supplied filename, and it contains a summary of all values that have remark codes. The list includes (for each parameter code)

every unique combination of remark code and value found, and a count of occurrences of that combination.

When processing is complete, the name of the file containing the data is displayed, and you may repeat the steps described above for developing a P-STAT file ([see Section 3.4.8](#)), or return to the Option 4 -- Data Output ([see Section 3.4](#)) menu.

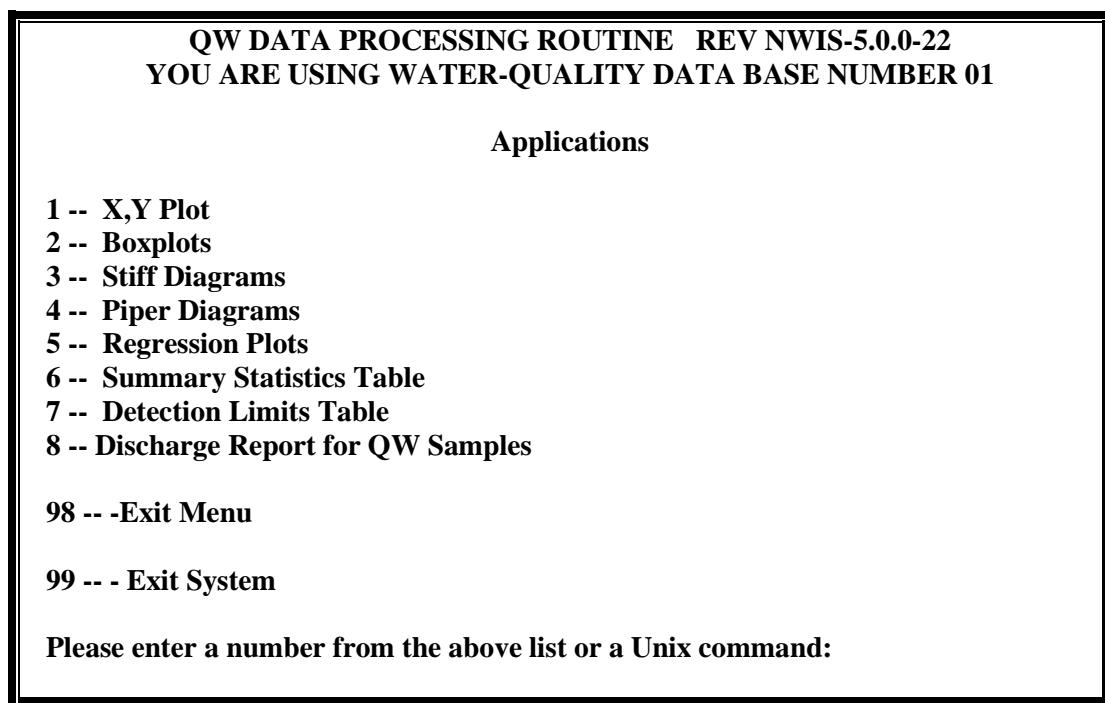

### 3.5 Option 5 – Applications

#### System Command **qwapplications**

The programs in the **QWAPPLICATIONS** menu may be invoked either by entering the command:

**qwapplications**

or by using Option 5 – Applications, from the main QWDATA menu. The following routines are displayed.

#### **Applications menu**

When in the QWAPPLICATIONS menu, you can use UNIX commands such as “**ls**” or “**more**” to list a directory or examine the contents of a file. When the selected program has completed, you will be returned to the QWAPPLICATIONS menu shown above. Use Option 99--Exit System to exit the software and Option 98--Exit Menu to return to the previous menu.

Options 1 and 5, **qwplot** and **qwregress**, require that a UNIX environment variable called **DISPLAY** be set to allow the program to plot in a separate window on your screen. The variable must be set from outside of QWAPPLICATIONS. The first message after invoking either of these programs is a message asking you to confirm that the variable **DISPLAY** has been set correctly.

The use of Ctrl-C to break out of any of these programs should be used with caution. Various results can occur if “**no**” is the response, including a hung cursor or using the “**no**” response for

another question in the queries. It is best to break out using the “yes” response to the quit and start over in the program of your choice.

### Input and Output Files for QWAPPLICATIONS

All programs in the QWAPPLICATIONS menu require an input file—either record numbers or data—to operate and an output file. Options 1–5 require an input file containing record numbers from the QW database, and this file has the format of one record number per line in columns 1–8 and can be generated through QWDATA ([see Section 3.3.1](#)) or created by using an editor. Examples of this input file are shown in [Appendix G](#).

### Applications Output

Options 1–5 generate graphics that require you to specify the output format. Options 1 and 5 use TKG2 to produce the plots, and the other options use S-PLUS.

From the TKG2 window, you can print the plot, save it as a TKG2 or G2 file, or export it into a FrameMaker Interchange Format (\*mif), Portable Document Format (.pdf), Portable Network Graphics (.png), or a Postscript file (.ps).

If you save plot as a FrameMaker Interchange Format (\*mif), you will need to complete some editing of the graph, so that the entire plot can be seen on the page. To do this, open the \*mif file in FrameMaker; use “Select All on Page” from the Edit pulldown menu; then choose “Group” from the Graphics pulldown menu; finally choose “Scale” from the Graphics menu, and make the scale factor 80 percent. You can move the entire plot to center it on the page after it has been scaled down in size.

When you save a plot in TKG2 format, you can edit it using TKG2. Open the plot in TKG2, and double click on the axis you would like to edit, or double click on the explanation to edit the data points in the plot. Use the editing windows that are displayed to change the appearance. To continue with the plotting program, exit from the TKG2 window.

When you use the programs that invoke S-Plus, a directory named NWIS\_Swork is created in your home directory. This directory will contain any files that are made while using the S-Plus graphics programs. When the graphics that invoke S-Plus are selected, the following list of device types is displayed.

**Enter the number of the device wanted**

**1 motif (X-window) graphics**

**2 pdf file**

**4 HP Laser Jet file**

**5 PostScript file**

**7 Tektronix 4010 window (from X-term or TerraPro)**

**9 EPS file**

If you select Option 1, a separate S-Plus window appears that includes the plot. To exit cleanly from this window, you should include all responses in the UNIX window, not in the S-Plus window. If you select Option 2, a PDF file is generated after you enter a filename. Known bugs exist for diagrams generated in a PDF format from the S-Plus window. For boxplots (Option 2 from the main QWAPPLICATIONS menu), the y-axis label is missing. If you select Option 4, a plot file in HP Laser Jet format is produced that you can print on printers that accept HP formatted graphics. If you select Option 5, a Postscript file is produced that you can print on printers that accept Postscript format. If you select Option 7, the plot will appear on a Tektronix 4010 window. To use a Tektronix 4010 window, you must be using an xterm window. When you select Option 7, a message appears in the UNIX window: “Enable Tek window output now.” While you are still in the UNIX window, press CTRL and the middle mouse button at the same time, and then activate the Tektronix window by selecting “Switch to Tek mode.” To view each plot, hit “enter” in the Tektronix window after each plot. To return to the UNIX window, deselect “Switch to Tek mode,” press CTRL and the middle mouse button at the same time, and deselect “Show Tek mode. If you select Option 9, you can choose the size of the plot you want and then print the file on printers that accept Encapsulated Postscript (EPS) format. You can choose five different sizes of output graphics; the list of options is displayed when you choose Option 9.

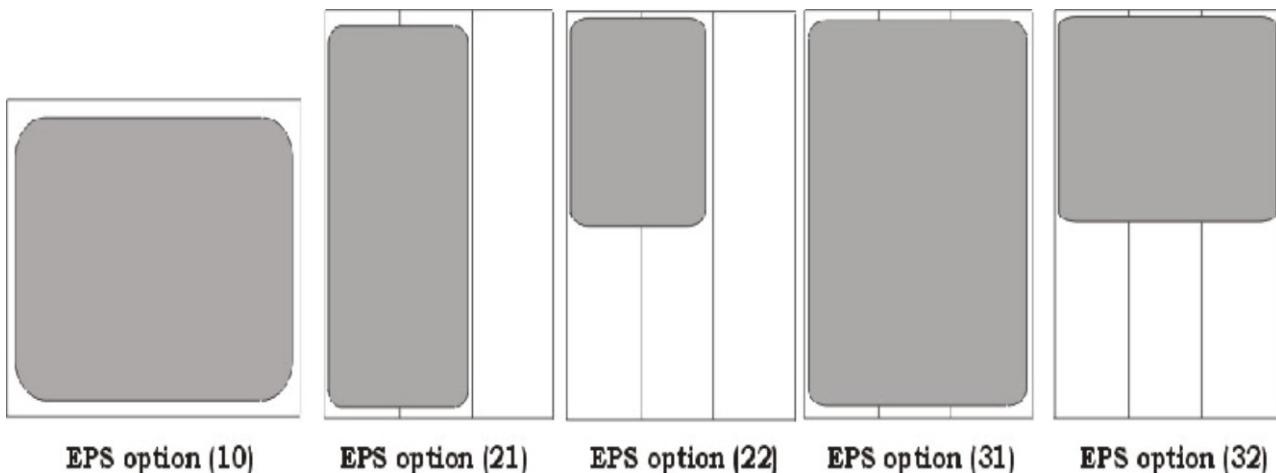

Enter the number of the plotsize wanted

The different options in the menu above are shown in example layouts below.

**EPS option (10)****EPS option (21)****EPS option (22)****EPS option (31)****EPS option (32)**

**NOTE: EPS files must contain only a single plot. This option will create multiple files. The filename format is basename\_##.eps.**

### 3.5.1 Option 1 – X,Y Plot

The qwplot program (Option 1) creates an X,Y plot in three stages: (1) by retrieving data from the QW database that are written to an ASCII file, (2) by using data in the ASCII file to create the plot in a separate graphics (TKG2) window, and (3) from the TKG2 window, the plot can be printed or saved to a file. All data are used in the plot, including remarked (i.e., less or greater than) results. Plots created with QWPLOT are limited to 5,000 data points.

The three stages used to complete the plot are described, and the software requests the name of the file containing the record numbers. The next prompt asks for the name of the output filename.

Three options exist for plotting the data: (1) from one to seven parameters by one parameter, (2) from one to seven parameters by sample date, and (3) from one to seven multiple stations by sample date for one parameter. All three options will handle data from multiple stations; however, only Option 3 will identify the individual stations on the plot.

If you choose Option 1, you must enter a five-digit parameter code for the x-axis followed by as many as seven parameters that will be plotted on the y-axis. If you choose Option 2, the x-axis parameter is sample data, and you can enter as many as seven parameters to be plotted on the y-axis. If you choose Option 3, the program reminds you that the file containing the record numbers must be sorted by station ID, date, and time. The x-axis parameter is sample data, and one y-axis parameter can be entered.

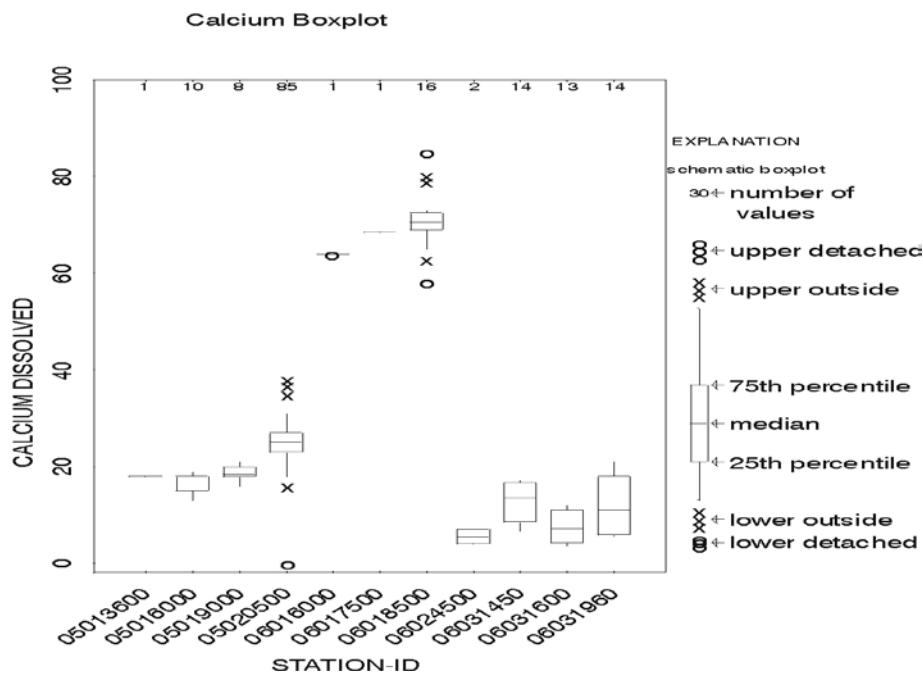

After you choose the plot type, the data are retrieved, some basic statistics (e.g., n, minimum, and maximum) are displayed on the screen, and you are asked if the data are to be listed to the screen. These data are the same data included in the ASCII output file and in the plot. You can then enter a title for the plot, and you can edit the x-axis and y-axis labels if the default choices are not acceptable. Although there is no limit on the length of the plot title or axis labels that can be entered, there is a practical limit because all text entered may not be visible on the plot. You may need to edit the font size in another application to see the entire title or label. You then can

choose whether the plot points will be connected with lines. Several seconds after this response, a separate TKG2 window will appear that contains the plot you requested.

### 3.5.2 Option 2 – Boxplots

The qwboxplot program (Option 2) creates boxplots in two stages: (1) by retrieving data from the QW database that are written to an ASCII file and (2) by using data in the ASCII file to create the plot in a separate graphics (S-Plus) window and write the output to a file. A boxplot is a simple graphic means of displaying statistics for the distribution of reported concentrations for a constituent. This program can generate several types of boxplots. The ends of the box (hinges) define the range of the middle 50

percent of the data, which is that part of the data between the 25th and 75th percentiles (the interquartile range). The median value of the data, the 50th percentile, is defined by a line across the box. The lines beyond each end of the box are called “whiskers,” and, in a schematic boxplot, they extend to the last value within 1.5 times the interquartile range beyond the ends of the box. Data points beyond the whiskers are called “outliers,” because their values differ greatly from the rest of the data. Outliers that extend from 1.5 to 3 times the range of the 25th and 75th percentiles are plotted as an “x,” and outliers that extend more than 3 times are plotted as an “o.” In a truncated boxplot, the whiskers extend to the 10th and 90th percentiles.

The qwboxplot program requires the standard input file of record numbers and an output file. The output file documents the retrieved data and is used as input to the plotting routine. The program then asks if you want to make a boxplot by using one station with one or more parameters, multiple stations with one parameter, or multiple stations treated as one station.

<b>Data-retrieval options</b>	<b>Code</b>
<b>One station with one or more parameters</b>	<b>1</b>
<b>Multiple stations with one parameter</b>	<b>2</b>
<b>Multiple stations treated as one</b>	<b>3</b>
<b>Enter code for option</b>	>

For any of the three options, the next request is for parameter codes that will be included in the boxplot. If you select Option 1 or 3, you can enter as many as 15 different parameter codes. The data values for each parameter code will be used to complete a boxplot for that parameter. If you select Option 1 and if the record number file includes data for more than one station, only the first station listed in the record number file will be used. If you select Option 2, one parameter code is entered, and the data values for each station will be used to complete a boxplot. If more than 15 stations are included in the record number file for Option 2, 16 stations will be shown on the x-axis, but only 15 boxplots will be drawn. Boxplots drawn for groups with less than 10 data values may not be complete. For example, if only one data value is available, only the median line is displayed. If plots for less than 10 data values are used for other than exploratory data analysis, groups with less than five data values should be displayed using the individual points. The data are retrieved, and summary statistics are displayed on the screen like those displayed below.

**RETRIEVAL OPTION 3: 2 PARAMETERS FOR A GROUP OF STATIONS**

---

**GROUPS RETRIEVED 2 MIN VALUE -10.000****GROUPS WITH DATA 2 MAX VALUE 758.000**

---

**SUMMARY OF VALUES BY GROUP:**

---

GROUP	NUM OF	25TH	75TH			
IDENTIFIER	VALUES	MINIMUM	PCTILE	MEDIAN	PCTILE	MAXIMUM
00010	165	-10.000	2.500	6.500	12.000	20.500
00095	154	36.000	132.000	178.000	213.000	758.000

---

If any censored values are found in the retrieved data, the software asks you if they should be estimated and what method should be used.

**RETRIEVING DATA ... RETRIEVAL COMPLETED****Censored values found in the data set.****Estimate censored values? Ans: y / n, <cr> = n >****Censored values can be estimated by either of two methods****Select the method you want:****1 - LOG-PROBABILITY REGRESSION****2 - ADJUSTED LOGNORMAL MAXIMUM LIKELIHOOD (default)**

For more information on these two methods see “Statistical Methods in Water Resources,” by D.R. Helsel and R.M. Hirsch, 1992.

The next queries ask whether you want the data to be listed to the screen and whether you want to plot the data. If you want to plot the data, then the options for the types of boxplots are displayed (schematic or truncated). After you select the type of boxplot, you can supply the title of the plot, the y-axis label (if you want it changed), and the x-axis label (if you want it changed). The S-Plus list of devices is displayed and you must select an output option as described above.

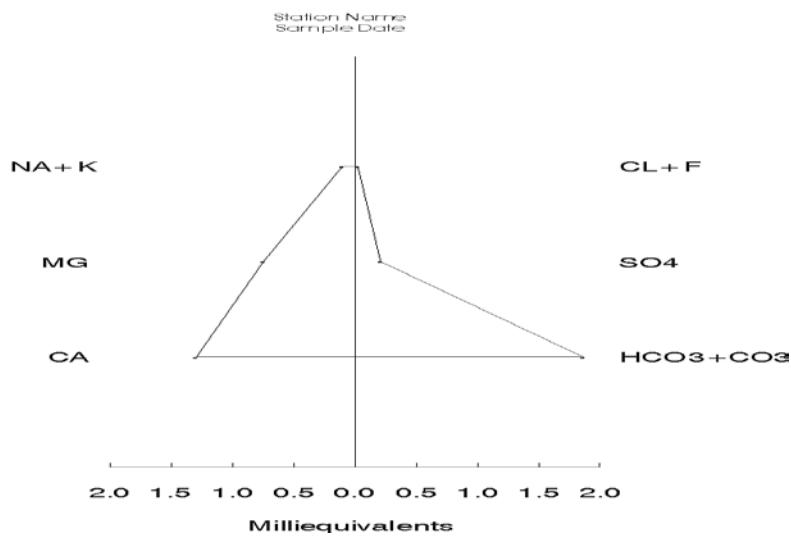

The data for the most recent boxplot are saved in the NWIS\_Swork directory as an S-plus dataset called spgu.boxplt. These data can be used in any S-Plus analysis. There is a [USGS library for S-plus](#) that facilitates hydrologic analyses.

### 3.5.3 Option 3 – Stiff Diagrams

The qwstiff program (Option 3) creates Stiff diagrams (Stiff, 1951) in two stages: (1) by retrieving data from the QW database that are written to an ASCII file and (2) by using data in the ASCII file to create the plot in a separate graphics (S-Plus) window and write the output to a file. By using S-Plus, Stiff diagrams are plotted in a separate window by using an input file of record numbers.

The Stiff diagram is a graphical representation of the cations and anions of an analysis in milliequivalents per liter. The Stiff plotting technique uses parallel horizontal axes extending on each side of a vertical zero axis (Hem, 1985, p. 175). Concentrations of the cations are plotted to the left of the vertical axis and anions to the right. The points are then connected, and an irregular pattern results. Thus, the patterns can be compared among analyses as well as among sites to illustrate similarities and differences.

The NWIS software plots the cations calcium and magnesium alone, and it combines the cations sodium and potassium. The anions, bicarbonate and carbonate, are combined, chloride and fluoride are combined, and sulfate is plotted alone. Each plot represents one analysis. All data are used in the plot including remarked (i.e., less or greater than) results. The software will not plot a Stiff diagram if any of the parameters are missing. Below is an example of a Stiff diagram produced from the software.

When the program is invoked, a query appears and asks if you want to plot the station name (local well number) instead of the station number. The program then requests the input filename of record numbers and the output filename (the output file is referred to as the “Sample Printout File”). The S-Plus list of devices is displayed, and you must select an output option as described above.

The output file (ASCII) contains the station number, date, and time for each record and a list of cations and anions. A missing value is represented by “-1.” An asterisk (\*) indicates that the bicarbonate value was computed from alkalinity, and a message is included at the end of the cation and anion list.

### 3.5.4 Option 4 – Piper Diagrams

The qwpiper program (Option 4) creates Piper diagrams (Piper, 1983). Piper diagrams can be used to show the chemical character of water. In a Piper diagram, selected cations (positively charged ions—calcium, magnesium, and sodium plus potassium) and anions (negatively charged ions—bicarbonate plus carbonate, sulfate, and chloride) for each analysis are shown as a percentage of the total cations and anions, in milliequivalents per liter. The cations are plotted as single points in the triangle on the left side and anions in the triangle on the right side. Cation and anion plots for each sample then are projected into the central diamond field. A water type can be described depending on the location of the projected point in the central diamond. The Piper diagram can be used to determine whether a particular water is (1) chemically similar to some other water or (2) a simple mixture of two chemically different water types (Hem, 1985, p. 177–179).

A water type in which one cation and one anion dominate (each amounts to 50 percent or more of the cations or anions, respectively) is designated by the names of the dominant cation and anion. A water type in which no cation or anion dominates is designated a mixed-cation or mixed-anion type (Piper and others, 1953, p. 26).

When the qwpiper program is invoked, the program asks for the file containing the record numbers (same format as Option 1), and then for the output filename. This output file is the ASCII file created for use with the plotting routine. If the filename exists in the working directory, the program asks if you want to overwrite the current file. Up to 2,000 points can be plotted using qwpiper. The program then displays the following options.

YOU HAVE THE FOLLOWING SYMBOL OPTIONS

FOR STATIONS:

\*\*\*\*\*

1. USE ONE SYMBOL, ONE COLOR
2. USE A DIFFERENT SYMBOL, ONE COLOR
3. USE ONE SYMBOL, DIFFERENT COLORS
4. USE DIFFERENT SYMBOL, DIFFERENT COLORS

\*\*\*\*\*

ENTER YOUR CHOICE:

***NOTE: Too many symbols may clutter a piper diagram, so that you cannot adequately view differences between symbols. Consider selecting a different option from the menu above to reduce the number of different symbols on your plot.***

If you select Option 1 or 3, you are prompted for a symbol (marker) number from 0 to 18 that corresponds to symbols listed in table 10. If you enter a carriage return, the default is 0, a square symbol. If you select Option 4, the program displays the following two options that allow you to choose when the symbols change.

**CHANGE SYMBOLS ON:**

\*\*\*\*\*

**1. EACH SITE (STATION)**

**2. EACH SAMPLE, REGARDLESS OF SITE**

**(COLOR CHANGES ON EACH SITE ONLY)**

\*\*\*\*\*

0	Square	10	Circle with + inside
1	Circle	11	Four small triangles joined
2	Triangle	12	Square with + inside
3	Plus symbol	13	Circle with X inside
4	X symbol	14	Square with a triangle inside
5	Diamond	15	Filled-in square
6	Upside-down triangle	16	Filled-in circle
7	Square with X inside	17	Filled-in triangle
8	Asterisk	18	Filled-in diamond
9	Diamond with + inside		

**Table 10. Symbols used for data values in Piper diagrams**

When you select symbol Options 2 or 4, symbols can be changed for each site or each sample. A choice of two symbol sets is available with Options 2 and 4. One set of symbols is the S-Plus symbol set, shown in table 10; the second set of symbols contains small and capitalized letters of the alphabet (52 different symbols). When you choose symbol Options 3 or 4, different colors are used to show a change of station (or, possibly, samples when Option 4 is used). The colors in the order they will be displayed are black, red, green, blue, yellow, cyan, and magenta. For Option 3, you choose a symbol, and a different color is used for each station in the plot. If more than 7 stations are plotted, the colors start over, so that the first and eighth stations will be black. The following table shows the colors that will be shown given the number of stations plotted (the station order is the same as in the record number file).

Station order number	Color used
1, 8, 15...	Black
2, 9, 16...	Red
3, 10, 17...	Green
4, 11, 18...	Blue
5, 12, 19...	Yellow
6, 13, 20...	Cyan
7, 14, 21...	Magenta

For Option 4, the colors are used in the same order and the symbols are used in the order shown in [Table 10](#). The colors and symbols are repeated when all have been used. The following example shows the colors and symbols that would be plotted if Option 1 –“CHANGE SYMBOLS ON: Each site” is chosen and 10 stations are plotted (the station order is the same as in the record number file).

Station order number	Color/Symbol used
1	Black/Square
2	Red/Circle
3	Green/Triangle
4	Blue/Plus symbol
5	Yellow/X
6	Cyan/Diamond
7	Magenta/Upside down triangle
8	Black/Square with X inside
9	Red/Asterisk
10	Green/Diamond with + inside

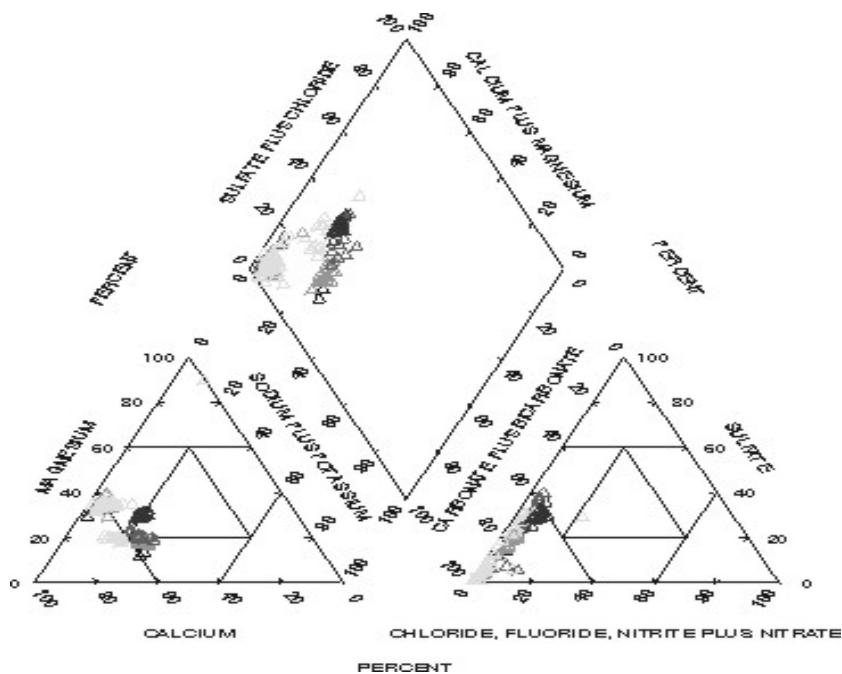

The final option is the size of the symbol to be plotted.

After you have entered the options for the plot, the S-Plus list of devices is displayed, and you must choose an output option as described above.

After you enter an output option are entered, an output file and plot are produced. The output file contains a list of cations and anions, the station number, date, and time for each record. A missing value is represented by “-1.” An asterisk (\*) signifies that the bicarbonate value was computed from alkalinity.

The data for the most recent plot are saved in the NWIS\_Swork directory as an S-Plus dataset called spgu.piper. These data can be used in any S-Plus analysis.

The figure below is an example of a Piper diagram produced from this program.

### 3.5.5 Option 5 – Regression Plots

The qwregress program (Option 6) creates an X,Y plot that can include a line calculated from a linear regression computation to fit a line through a set of results. The linear regression is performed by the IMSL subroutine RLONE and is described in the “IMSL Reference Manual,” v.4 (IMSL, Inc., 1982). The confidence interval for the coefficient and for the intercept is 95 percent. In the output file, the results of the regression computation are included with the data used in the computation.

The regression plot and output file are created in three stages: (1) by retrieving data from the QW database that are written to an ASCII file and the linear regression is computed, (2) by using data in the ASCII file to create the plot in a separate graphics (TKG2) window, and (3) from the TKG2 window, the plot can be printed or saved to a file. All data are used in the plot, including remarked (i.e., less or greater than) results. Plots created with qwregress are limited to 9,999 data points. You must have at least three values for the program to work. After describing the three stages used to complete the plot, the software requests the name of the input file of record numbers. The next prompt asks for the name of the output data file, which is an ASCII file that contains the data and results from the regression computation.

You must enter a code that describes whether one plot should be made for all stations or if one plot should be made for each station in the record number file. After you enter the code, you have the option to include the regression line on the plot. Enter one parameter code for the x-axis and one for the y-axis. After entering each parameter code, you can enter a multiplier that will be used on the values for that parameter. The next prompt asks whether log transformations should be performed on the values for the x and y axes. A summary of the variables to be used in the

regression computation and plot is shown on the screen. You can use this summary to determine if the choices are correct. If the choices are not correct, you can reenter the information.

Several seconds after answering “**Yes**” to whether or not the regression variables are correct, a separate TKG2 window appears that contains the plot you requested. To continue with the plotting program, exit the TKG2 window. After the TKG2 window is closed, you are asked if you would like another set of parameters processed. If “**Yes**,” the program asks for the x-axis parameter code and follows the steps described above; if “**No**,” the program ends.

### 3.5.6 Option 6 – Summary Statistics Table

This option runs a program that reads data and parameter-name files created by using Option 5 (flat file by sample) from the Data Output menu. To create these files, select a fixed-column flat file from the output format selection (*see Section 3.4.5.1, Selecting the Output Format*). These output files are used to produce a table of summary statistics. The heading on the summary table requires information from the SITEFILE that is obtained by using the following alpha codes as the first three codes in the parameter list used to make a flat file by sample.

#### **AGNCY, STAID, DATES**

The above three codes must be present in the parameter list. The following code also may be present.

**81024 (DRAINAGE AREA)** may be included and will be used as the drainage area in place of the contributing drainage area.

The program asks for the name of the fixed column, space-delimited file. The program then asks for the parameter-list filename. This file is created by a run of qwflatout, or you may create your own file by using the format described in [Section 3.4.5.1](#). The names need to be in the same order as the input data. The program then prompts for the output filename and asks if you wish to report estimated percentiles for censored parameters.

At this point, the interactive portion of the qwprcntl program is finished. This program may run for a long time, depending on the number of parameters that are to be processed and the number of records.

Parameters in the output from the program are listed in publication order. The order in the input files is ignored. A log-probability regression procedure is used to estimate the mean (and the percentiles, if requested) of censored parameters. This procedure handles multiple-detection limits. The methods used are as listed below.

**Uncensored parameters:**

1. The data are ranked in ascending order, and positions for the percentiles are found using the following formula:

$$K = Pct * (N + 1)/100 ,$$

where K is the expected position, Pct is the integer percentile (e.g., for the 5th percentile, Pct = 5; for the 25th percentile, Pct = 25) and N is the number of observations.

If the position K is a whole number, then the value in that position in the rank-ordered data is the value used for the percentile. If K is not a whole number, then the following interpolation is used:

$$P(Pct) = X(\text{trunc}(K)) + (K - \text{trunc}(K)) * (X(\text{trunc}(K)+1) - X(\text{trunc}(K)))$$

where P(Pct) is the desired percentile, X() is the rank order data set, trunc(K) is the truncated value of K, and Pct is as above.

2. If the number of observations is greater than 1 and less than or equal to 5, only the maximum and minimum are reported.
3. If the number of observations is equal to 1, only the maximum is reported.
4. If the maximum is equal to 0.0, only the maximum is reported, regardless of the number of observations.
5. All values in uncensored parameters are treated the same regardless of any codes associated with those values.

**Censored parameters:**

1. If the percentage of values flagged with “<” or “U” is greater than 5 percent of the total number of data values for the parameter, the parameter is considered censored.
2. The mean of censored parameters is estimated with a log-probability regression procedure. The method estimates the values below a detection limit and uses these values and the detected values of a parameter to estimate the mean. The FORTRAN implementation of this method was done by the former Systems Analysis Group, WRD, and USGS. This method was chosen as the best way to handle the problems presented by multiple-detection limits in water-quality data. The estimated mean is flagged with an “\*” and explained in a footnote on the statistical summary table. If the number of censored parameters included in the computation is 95 percent or more of the total number of values to be used, the mean will be reported as “\*\*\*\*\*” in the output table.
3. If estimated percentiles are requested, the same procedure that is used to estimate data below the detection limit for the calculation of the mean is used to estimate the data below the detection limit and to calculate the percentiles. The percentile values are calculated using the same method as described in Part 1 of the previously mentioned

uncensored methods. These values also are flagged with an “\*” to indicate that they are based on an estimated data set, and the “\*” is explained in a footnote.

4. If nonestimated percentiles are requested, only actual values are used for the percentile values in the statistical table. The percentiles retain a “<” flag if one is associated with the value originally and no interpolation between values is used. To establish the set of sorted data that the percentiles are selected from, all values flagged with “<” or “U” are assumed to be less than any value without a flag. For example, the following values are shown in the ascending order that would be used.

<0.1 <1 <20 .01 17 500

- a. Only “<” and “U” remark codes are used to distinguish censored from uncensored parameters, and subsequently values flagged with these remark codes are established as less-than values in the statistical procedures. Other remark codes are processed as follows:

E, A, S, V, and R — treated as a detected value;  
> — values dropped from statistical procedures if a censored value is also present in the sample set;  
M — values dropped from statistical procedures; and  
N — values dropped from statistical procedures.

- b. If the average of two values must be taken to obtain the value for a percentile, the remark code of the greater value is associated with the percentile.
- c. Any values equal to 0 in a censored parameter are replaced with the value of the nearest less-than value (in time-order) and the remark code is set to “<.”
- d. If the number of observations above the detection limit is less than 5, the estimated values are considered unreliable and are not reported.
- e. If the total number of observations (above and below the detection limit) is greater than 1 and less than or equal to 5, only the maximum and minimum are reported.
- f. If the total number of observations is equal to 1, only the maximum is reported.

#### **Effective limits of the program:**

1. The maximum number of parameters (header and water quality) cannot exceed 1,000.
2. The maximum number of values per parameter per station is set to 5,000.

#### **3.5.7 Option 7 –Detection-Limits Table**

The qwdetlims program (Option 7) reads the data and parameter-name file created by a run of qwflatout ([Section 3.4.5.1](#)) and produces a table of detection limits. The heading on the table requires information from the QW database that is obtained by using DATES in the parameter list passed to qwflatout.

The qwdetlims program produces a table of detection limits encountered in the input data file for each parameter in the parameter list file, excluding the alpha parameter codes and the numeric codes for mean discharge, instantaneous discharge, and drainage area (00060, 00061, and 81024,

respectively). A maximum of 350 valid numeric parameter codes can be handled by the program, and a maximum of 19 years can be processed for each run.

The program asks for the input data filename created by qwflatout. The program then asks for the parameter list filename; this file is created by qwflatout, or you may create your own file by using the format described in [Section 3.4.5.1](#). The names need to be in the same order as the input data.

The program then asks for the output filename and asks if you want to specify the period of record to be used (19 years, maximum) or to use the dates from the input data file (only the last 19 years will be counted). If you specify the period of record, you are then asked for the beginning year and the ending year.

At this point, the interactive portion of the qwdetlims program is finished. This program may run for a long time, depending on the number of parameters that are to be processed and the number of records.

The output table is headed by the name of the parameter from the parameter-list file, the corresponding parameter code, and the total of the nonmissing values encountered for that parameter. The table consists of a column of detection limits encountered (a data value with a remark code of “<” or “U”), columns of counts of detection limits encountered for each selected year (up to a maximum of 19 years), a summary column (the total of the counts for that detection limit), and a final column giving the percentage of the total, nonmissing values represented by that detection limit. The rows are in the order of detection limits as they are encountered in the input data.

The input data file is considered as a whole. By selecting appropriate record numbers to be used by qwflatout, qwdetlims can be used to show detection limits encountered for a single station, a single county, a specific project, a single year, or any period of years up to 19. If the output from qwflatout had 50 years of data, it could be processed by qwdetlims in three runs.

One use of the detection limits table is for locating probable order-of-magnitude data errors. For example, if a parameter has a detection limit of <0.5 for a period of years and a single (or few) detection limit(s) of <50, the single-data value probably should be reviewed. Another use is for evaluating the data before or as they are used in statistical analyses.

### 3.5.8 Option 8 – Discharge Report for QW Samples

This option is used to produce a file that contains suggested water-discharge results for surface-water-quality samples. The program will select the samples from input of record numbers or agency code, station ID, date, time, and medium code to generate the output file. You may enter this information from the terminal or from an existing file. The format of this file is described in [Appendix G](#). The format of the optional input files is described in [Appendix G](#). If you choose to enter the record numbers interactively, use the process used described in [Section 3.3.4](#). Records can be retrieved from multiple databases during a single retrieval, if the database (“db”) numbers are appended to the record numbers as in the format #####db.

After the desired samples are specified, you will be prompted to enter a filename for the output report (or “q” to quit). Next, the format of the output report is specified. As shown below, there are two choices.

**Which format do you desire:**

**1. RDB (tab-separated)**

**2. Print-ready**

**Please enter option (1,2,q, <CR>=1): \_**

See [Appendix C](#) for examples of the output. See [Tip Sheet 5.21](#), “How do I rapidly determine discharge for surface-water-quality samples?” for additional information.

- 8 -- Display the Parameter Method Table**
- 9 -- Display Analyzing Entity and Collecting Agency Codes**
  
- 98 -- Exit menu**
  
- 99 -- Exit system**

**Please enter a number from the above list or a Unix command:**

**Support Files menu options.**

### 3.6.1 Option 1 – List Site Records

Option 1, List Site Records, produces a list of the contents of the site information for selected sites from the SITEFILE. If the output is directed to a file, the program asks for the output filename; if you do not enter a filename, the output will be put into a file named SITE\_LIST. The output can also be directed to the screen. You are then asked if station numbers will be entered from the terminal. A maximum of 400 station numbers are accepted; if more than 400 are submitted, only the first 400 will be used. If you enter the station numbers from the terminal, a blank line is displayed. Enter the five-character agency code (a blank space will follow if a four-character agency code is entered) and the station number. Depending on the agency code and length of station number, the input would look like the following example.

**USGS 01123456  
USEPA01123457  
USGS 390000110300001**

If you enter “**NO**,” you are prompted for the name of a file that contains a list of station numbers. The input file should be in the following format.

**Agency code -- 5 characters (left-justified)  
Station number -- 15 characters (left-justified)**

The output file includes carriage-control characters and should be printed with the “asa” U command. Example output is included in [Appendix C](#).

### 3.6.2 Option 2 – Scan for and Display Parameter Codes and Definitions

Option 2, Scan for and display parameter codes & definitions, retrieves records from the parameter code dictionary and displays the parameter code and descriptive name on the screen. [Parameter codes \(see Section 2.1.3\)](#) are five-digit numbers used to identify water-quality constituents and properties. Two types of retrievals are available: by parameter name or by parameter code. See [Tip Sheet 5.8](#) for a more detailed discussion.

***NOTE: This program displays parameters that are currently valid for data entry and public display. Parameters that do not fit into these categories will not be displayed but can be retrieved using Option 3, described below.***

After starting the **qwpcdpeek** routine, you must decide if the records will be retrieved by parameter name or parameter code from the following menu.

Only parameters that are displayed to the public  
and can be entered into NWIS are retrieved by this  
program  
Do you want to identify parameters by:  
1. code  
2. name  
Please enter option (1,2,q):\_

**Screen to check the Parameter Code Dictionary.**

If you select Option 1, parameters are retrieved when valid input codes are entered. Valid input consists of a single 5-integer string, a range of parameter codes separated by a hyphen, or use of the Boolean expressions “<,” “>,” “=<,” or “=>” with a parameter code. Input may be from a file or from the screen. Output will be directed to the screen.

Choosing Option 1 results in the following system prompt.

Do you want to enter parameters from the terminal? (y,n, <CR>=y): \_

Choosing entry from the terminal (default choice) results in the next prompt.

Enter parameter codes (<CR> to quit)  
(To retrieve a range, enter PCODE-PCODE; <PCODE; >PCODE; <=PCODE; >=PCODE)

1: \_\_\_\_\_

At this point, you may enter a five-digit parameter code, a range of codes with a hyphen in the middle, or use the greater-than or less-than operators to search. The parameter code(s) and parameter name(s) will be shown on the screen.

If you answered “**n**” to the previous prompt to enter parameters at the terminal, the next prompt will look like this.

Enter the pathname of the  
input file (q to quit): \_\_\_\_\_

The program requires a simple text-file formatted with integers in the first 5 columns, followed by a carriage return or a space. It does not read anything after the space to the right. It will also accept a range of parameters separated by a hyphen or use of the “=,” “<,” or “>.”

If you select Option 2, a list of parameters containing the input “name” character string is retrieved. The program will search all parameters for any part of the string anywhere in either the parameter short -name or parameter long name fields. Note that parameter short names may use different expressions than the “official” parameter long name uses and that differing search results may be obtained. Input may be from a file or from the screen. Output will be directed to the screen. After choosing Option 2, identify parameters by name results in the following system prompt.

Do you want to enter parameter names from the terminal? (y,n,q, <CR>=y): \_

Choosing entry from the terminal results in the next prompt.

Enter parameter names (<CR> to quit)  
1: \_\_\_\_\_

At this point, you may enter a parameter name, partial name, or string of characters. All parameter codes and names that contain the character string anywhere in the parameter long name or short name will be displayed to the terminal.

If you answered “**n**” to the prompt to enter parameter names at the terminal, the next prompt will look like this.

Enter the pathname of the  
input file (q to quit): \_\_\_\_\_

The input file should have a format as described above for terminal entry. Place separate name searches on their own lines in the text file.

To exit this program, enter “**q**” and you will return to the Support Files menu.

### 3.6.3 Option 3 – Write Parameter Report to a File

Option 3, Write parameter report to a file, allows you to search or dump table-selected column subsets of, or the entire, parameter code dictionary to a file, based on interactively-entered search criteria. The basic steps are: (1) select parameters, (2) optionally sort the rows, (3) select an output format, and (4) select the output columns. This program routine is **qwpcdtable**. Example output is included in [Appendix C](#).

The parameter code dictionary contains a mix of codes used by the USGS and historical parameters used by the EPA. This latter group of parameter codes disallows new data entry. These codes are easily distinguished by parameter names and column headings appearing in all upper-case letters.

If you would like to retrieve the Parameter Code Dictionary with method-information and/or precision-arrays, see [3.6.8 Option 8](#) below.

#### 3.6.3.1 Selection Criteria

When the program is initiated, you will be prompted for an output filename. A box will next appear to help limit the retrieval selection criteria. The retrieval choices are shown in 11 fields, which reference similar columns in the parameter code dictionary.

<b>qwpcdtable</b>	
Enter file to hold output: examplefile_____	
<div style="border: 1px solid black; padding: 5px;"><p>[Selection Criteria]</p><p>Enter a Y to choose an item for limiting retrieval, Enter a # to remove an item, Enter ?/ for help</p><p>1) Pcode: _ 2) Group: _ 3) Long Name: _ 4) Adaps Name: _ 5) EPA-SRS Name: _ 6) Units: _ 7) CASRN: _ 8) Medium: _ 9) Fraction: _ 10) Time-series flag: _ 11) Public flag: _</p><p>Cursor controls (?/ for help)</p></div>	

Entry of a “**y**” at any of the 11 criterion will enable a submenu specific to that item. Entry of “**y**” in more than one of the Selection Criteria fields has the effect of the Boolean term “AND” in a search and, possibly, further shrinking of output. To dump the entire parameter code dictionary, do not select any of the 11 criteria, and you will be directed to the sorting options menu described in [Section 3.6.3.2](#) below.

When text strings are entered to restrict the search for parameters by: Long Name, Adaps Name, EPA-SRS Name, units, CASRN, or fraction the text strings are used as a case-insensitive text fragment to match the target. For example, entering "arsenic" for the EPA-SRS name will match both "Arsenic" and "Arsenic acid".

Limiting by **1) Pcode** will have the same functionality as described in [Section 3.6.2 –Scan for and display parameter codes & definitions](#), Option 1 above. A list or range of parameters can be entered from a file or interactively at the screen.

**2) Group** will prompt a submenu. Each parameter is associated with one group. Users may be familiar with these current groups from the use of NWISWeb. This functionality would enable you to retrieve a file of parameter codes to use later for quicker Data Output ([Section 3.4](#)) of common data groupings shown below.

[Parameter Group Selection Criteria]
Enter a Y to choose an item for limiting retrieval, Enter a # to remove an item, Enter ?/ for help
1) Information: _ 2) Physical: _ 3) Inorganics, Major, Metals: _ 4) Inorganics, Major, Non-metals: _ 5) Nutrient: _ 6) Microbiological: _ 7) Biological: _ 8) Inorganics, Minor, metals: _ 9) Inorganics, Minor, Non-metals: _ 10) Organics, pesticide: _ 11) Organics, PCBs: _ 12) Organics, other: _ 13) Radiochemical: _ 14) Stable Isotopes: _ 15) Sediment: _ 16) Population/Community: _ 17) Habitat: _ 18) Toxicity: _ 19) Other: _
Cursor controls (?/ for help)

**3) Long Name** will prompt for a list of “names” or character strings.

**4) ADAPS Name** will prompt for a character-string input. Only a few parameters are annotated with ADAPS names.

**5) EPA-SRS Name** will prompt for a character-string input from the screen and will search parameters populated from the EPA-Substance Registry System.

**6) Units** will prompt for a character-string input from the screen and will search the reporting units (parm\_units\_tx) field. The search is not case sensitive; for example, “mg/kg” is acceptable. Short text expressions for units of measure were coordinated with the EPA. The collaborative list of units can be found at: <http://qwwebervices.usgs.gov/service-domains.html>.

**7) CASRN** will prompt for a character-string input from the screen and will search the name field associated with the Chemical Abstract Service reference number for each parameter.

**8) Medium** will prompt a submenu. Your choices include: Air, Water, Biological Tissue, Other, Sediment, and Soil.

**9) Fraction** will prompt for a character-string input from the screen. Your choices include: Acid Soluble, Bedload, Bed Sediment, Comb Available, Dissolved, Free Available, Non-filterable, Non-settleable, Non-volatile, Recoverable, Settleable, Suspended, Total, Total Residual, Vapor, and Volatile.

**10) Time-series flag** will only search parameters that have the flag set in the parameter code dictionary (parm\_ts\_fg) for use in time-series (ADAPS). If you enter a blank or an “N” is entered into this field, then this flag is not considered during the selection. If you enter a “Y” into this field, then this flag is considered during the selection.

**11) Public flag** will only search parameters when this entry is set to “Y” or “N.” An entry in this field is required if the public parameter status (parm\_public\_fg) is to be considered during selection. If you enter an “N” into this field, then parameters not available to the public are considered during the selection. If you enter a “Y” into this field, then parameters available to the public are considered during the selection. If you leave this field blank, then all parameters are considered during the selection.

Output will include parameters that are not available for new data entry, as well as parameters not publicly displayed on NWISWeb.

### 3.6.3.2 Sorting Options

You will be given the option to sort your retrieved results by up to seven fields. This step is optional. Enter an integer at each prompt in your desired order of precedence. The screen will look like the following example screen.

qwpctable	
Enter file to hold output: examplefile_____	
[Sorting Options]	
Enter a 1-7 to specify sort order,	
Enter a # to remove an item	
1) parameter code: _ 2) parameter group: _ 3) medium: _ 4) fraction: _ 5) parameter long name: _	
6) publication-sequence number: _ 7) EPA-SRS name: _	
Cursor controls (/? for help)	

After the “Search Criteria” and “Sorting Options” are populated, the parameter code dictionary will be searched, and if successful, you will be prompted to select an output format (see next section. 3.6.3.3). If no parameters are found, you will be given the option of trying again or quitting back to the Support Files menu. **Note: If an unsuccessful search returns zero parameters and you “try again,” the system retains your earlier selections. You will have to move the cursor to each item to edit or deselect it.**

### 3.6.3.3 Specify the Output Format

These options provide user flexibility with the resulting output formats. The first choice is well suited for other QWDATA retrievals that utilize a file of parameter codes, the second choice can be used for printing the results, and the third option gives the results in an RDB-file for usage outside of QWDATA.

qwpcdtable
Enter file to hold output: examplefile _____
Specify the output format:
1. Parameter-file for use in retrievals (Pcode + Long Name)
2. Print formatted text report
3. RDB-file report
Please enter option (1,2,3,q): _____

If you choose Option 1, no further dialogue takes place, and the output file is written. The format places the parameter code in columns 1–5 and the long name in columns 7–176, with one parameter per line.

If you choose Option 2, you will be prompted to format or customize the output contents. You will select at least one line of output that will contain the parameter code and one type of name. The second and third output lines are optional with five choices. Examples of dialogue boxes follow.

qwpcdtable
Enter file to hold output: examplefile _____
Specifying the contents of the parameter print-format report.
The parameter code will appear on line 1 of the output report.
You may select one of the following names to also appear on line 1:
1. Long name
2. Short name and units
3. ADAPS name
Please enter option (1,2,3,q): 3_____

### **qwpctable**

Enter file to hold output: examplefile \_\_\_\_\_

Specifying the contents of the parameter print-format report.  
Parameter code and ADAPS name has been selected for line 1.

For line 2 of the output report you may select:

1. No more report lines
2. Long name
3. Short name, units, entry, and public flags
4. ADAPS name
5. EPA-SRS Name
6. Order, CAS registry number, Medium, and Fraction

Please enter option (1,2,3,4,5,6,q): 6

### **qwpctable**

Enter file to hold output: examplefile \_\_\_\_\_

Specifying the contents of the parameter print-format report.

Parameter code and ADAPS name has been selected for line 1.

Order, CAS registry number, Medium, and Fraction has been selected for line 2.

For line 3 of the output report you may select:

1. No more report lines
2. Long name
3. Short name, units, entry, and public flags
4. ADAPS name
5. EPA-SRS Name
6. Order, CAS registry number, Medium, and Fraction

Please enter option (1,2,3,4,5,6,q): 1

If you choose Option 3, you will be prompted with a dialogue box to indicate which fields should be added to the output. Parameter code will always be in the first field even if no other choices are made. The RDB-fields are listed below.

- PCODE: 5s
- Long\_Name: 170s
- Short\_Name: 29s
- ADAPS\_Name: 112s
- EPA-SRS\_Name: 75s
- Units: 10s
- CASRN: 15s

- Pub Order: 5n
- Medium: 30s
- Fraction: 24s
- Entry: 1s
- Public: 1s
- Group: 1s
- USGS EPA equiv: 26s

<b>qwpctable</b>	
Enter file to hold output: examplefile _____	
 [RDB Columns] Enter a Y to include the column in the retrieval, Enter a # to remove an item, Enter ?/ for help	
1) Long Name: _____ 2) Short Name: _____ 3) ADAPS Name: _____ 4) EPA-SRS Name: _____ 5) Units: _____ 6) CAS RN: _____ 7) Pub Order: _____ 8) Medium: _____ 9) Fraction: _____ 10) Entry: _____ 11) Public: _____ 12) Group: _____ 13) USGS EPA equiv: _____	
Cursor controls (?/ for help)	

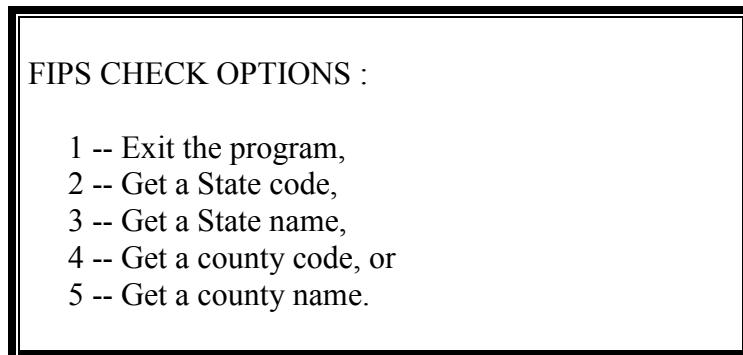

### 3.6.4 Option 4 – Check Geologic Unit Code File

Option 4, Check Geologic Unit Code File, retrieves geologic unit codes and formation names and displays them at the terminal. The program asks for a geologic unit code and retrieves the associated name.

You can provide the entire geologic unit code (for example, 111ALVM) and, if that code exists, get back the formation name (Holocene alluvium) or a partial geologic unit code from one to eight characters. An entry of the partial geologic unit code (12) results in retrieval by partial key search of all geologic unit codes and associated formation names between 120xxxxx and 129xxxxx. A blank geologic unit code terminates the program. The file of valid geologic unit codes is located at: /usr/local/nwis/support/aageol.all.states.

### 3.6.5 Option 5 – Check Federal Information Processing Standards (FIPS) Code

Option 5, Check FIPS Code, is used to browse the FIPS Code file and retrieve a State code given a State name, a State name given a State code, a county code given a State-county name, and a county name given a State-county code. The following options are displayed on the screen.

**Screen to browse FIPS Code file.**

After you make a choice from the menu, the program requires you to enter the required information from the terminal. All responses from the program are output only to the screen.

### 3.6.6 Option 6 --- List State/County Data

Option 6, List State/County Data, interacts with the FIPS file and is used to retrieve a tabular list of State names, State abbreviations, State codes, minimum and maximum latitudes, and minimum and maximum longitudes. You also may retrieve county names, county codes, minimum and maximum latitudes, or minimum and maximum longitudes for a single State. A third option allows you to retrieve all states and counties with abbreviations, codes, and maximum and minimum latitudes and longitudes. The output can be to the terminal or to a file. Example output is included in [Appendix C](#).

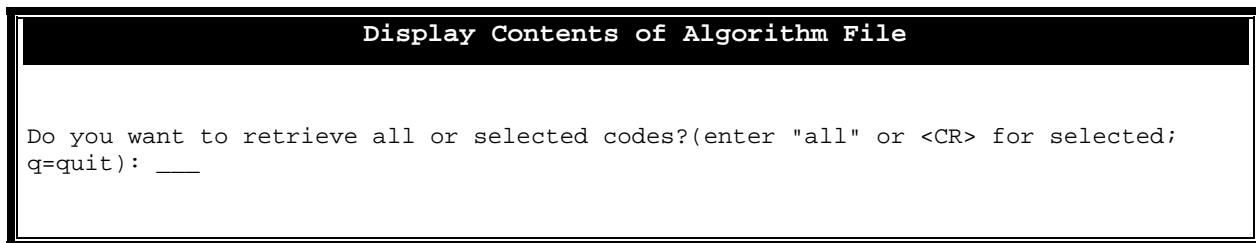

### 3.6.7 Option 7 – Display algorithm in reverse Polish notation (RPN)

Option 7, Display algorithm in reverse polish notation, retrieves and lists any or all of the algorithms used for calculating specific parameters. Reverse Polish notation is a computational technique that may be visually easier to digest than a simple algebraic expression of the same algorithm. The output format is seven columns in width, with a variable number of rows. Each row represents an operational sequence step in the overall calculation; therefore, the number of rows will vary by computational complexity of the algorithm. You may record a trace of the computational steps performed by each algorithm to reach, or fail to reach, a final value.

Additional information and discussion about this capability is included in [Appendix D](#).

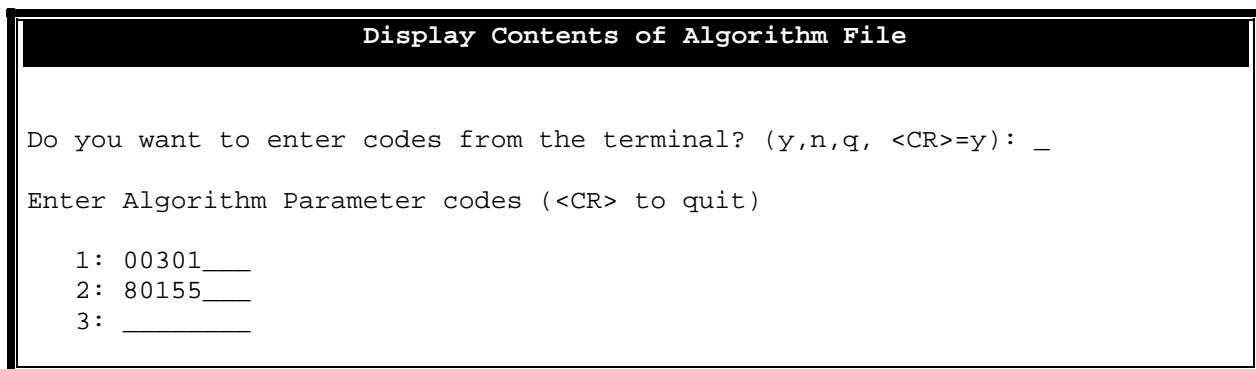

#### 3.6.7.1 Specifying the Algorithm Output

A series of three prompts will allow you to output a report listing the desired algorithms. You are first prompted to choose “**all**” or specific “**selected**” algorithm equations to retrieve. The default option is “selected” algorithms, and it is chosen with a <CR> or the enter key.

**Screen to specify algorithm(s).**

The second prompt asks you for the source of the calculated-parameter code(s) desired. An answer of no “**n**” at this prompt implies that a file of parameter codes is available. You will be asked for the path to that file (see [Section 3.4.3.3](#) for the file format).

**Screen to specify source of parameter code(s).**

The final prompt asks if you would like to print the output either to the screen or to a file. The default option is to the screen.

Display Contents of Algorithm File						
Do you want the report to be printed to the screen? (y,n,q, <CR>=y): _						

**Screen to specify output destination.**

### 3.6.7.2 Algorithm Display Output

When output to the screen, column headings are presented above the algorithm's sequence rows. Following is an example of the report output to the screen for parameter code 80155.

Parm Code	Grp	Seq	Opcode	Operand	Stk	Comment
80155	2	1	ReqPush	80154	1	Load: Suspnd sedmnt conc, Exit i
80155	2	2	ReqPush	00061	2	Load: Discharge, instant.
80155	2	3	*		1	Multiply
80155	2	4	ConstPush	0.002700000	2	Constant
80155	2	5	*		1	Multiply

Page 1 (<CR> to continue, Q to quit):

**Example output to the screen.**

The columns in the output consist of the following information.

- Parm Code: Five-digit parameter code representing the compound to be calculated.
- Grp: A grouping of which additional programs, if any, calculate this parameter; has one of the following four conditions:
  - “0” Output algorithm result only if requested by PCODE, or
  - “1” Output algorithm result if requested by CALCV (Appendix A) or PCODE, or
  - “2” Output algorithm result if requested by CALCV and QWRELOADOUT (Section 3.9.6) or PCODE, or
  - “3” Output algorithm result in WATLIST (Section 3.8) and if requested by CALCV and QWRELOADOUT or PCODE.

- Seq: Sequential operational step number.
- Opcode: Operation code for the data-retrieval or computational operation to perform. See Appendix D.
- Operand: A reference to a Constant, a result stored in a Parameter Code, or another algorithm calculated by Parameter Code.
- Stk: The number of discrete values on the RPN stack after the operation completes.
- Comment: Text description of the operand, including chemical-logic reasons why this operation is performed.

Requesting output to a file will write an ASCII file, delimited with the TAB character, and require input of a filename. The columns in the tab-delimited file are the same as screen output.

### 3.6.8 Option 8 – Display the Parameter Method Table

Option 8, Display the Parameter Method Table, allows you to list the contents of the method-related reference tables. The information available for output from this menu option includes: parameter code, parameter name (long and short names), historical method code (prior to NWIS 4.6), method code, rounding (precision) array, method name, method description, method number, citation for the method, and long citation description for the method. You may select all parameter-method pairs in the output or specific parameters or may specify specific parameters and methods. Sample output can be found in [Appendix C](#).

**Note: You may only retrieve historical parameter information (those disabled for new data-entry) by retrieval of “all” or specific parameters.**

For each parameter-method code pair in the parameter-method table, a rounding array is stored for a range of expected values. This rounding array is used when default rounding is selected for output (see [Section 3.4](#) for more information on output from QWDATA). More information about the parameter-method table is available in [Section 2.5.6](#). The parameter-method table contains one 10-element integer array (PROUND) that contains the default rounding codes for each parameter-method pair. The magnitude of the greatest significant figure in a result determines which PROUND element (1–9) is used to round the result. The tenth element of the array (MAXDEC) indicates the maximum number of decimal places that may be used to display a value for the parameter-method combination. The elements of the PROUND array have definitions as shown the example below for parameter code 00010/method THM01, water temperature, with PROUND array: 0012333331.

PROUND element number	For values in the range	Display number of significant digits
<b>1</b>	<b>&lt;0.01</b>	<b>0 (values this small not expected)</b>
<b>2</b>	<b>&gt;=0.01 - &lt;0.1</b>	<b>0 (values this small not expected)</b>
<b>3</b>	<b>&gt;=0.1 - &lt;1.0</b>	<b>1</b>
<b>4</b>	<b>&gt;=1.0 - &lt;10.0</b>	<b>2</b>
<b>5</b>	<b>&gt;=10.0 - &lt;100.0</b>	<b>3</b>
<b>6</b>	<b>&gt;=100.0 - &lt;1000.0</b>	<b>3</b>
<b>7</b>	<b>&gt;=1000.0 - &lt;10000.0</b>	<b>3</b>
<b>8</b>	<b>&gt;=10000.0 - &lt;100000.0</b>	<b>3</b>
<b>9</b>	<b>&gt;=100000.000</b>	<b>3</b>
<b>10</b>	<b>Max Decimal Places</b>	<b>1</b>

For more information on rounding codes, see [Section 2.7.1 – Rounding](#) and [Tip Sheet 5.19: How can I round my results in QWDATA output?](#)

When you select Option 8, the menu on the following screen is displayed.

- ```

1. Output parameter-method information (RDB delimited)

2. Output parameter-method codes, precision array, and parameter
long name

3. Output parameter-method codes, precision array, and parameter
short name

4. Output parameter-method codes, precision array, parameter short
name, and method name

```

Please enter (1,2,3,4, or Q to quit):

All four output options include a column named “newentry” that indicates if a parameter and method pair is disabled for new data entry. This column will be blank if the parameter-method pair may be used for data entry or “disabled” if forbidden. Sometimes, no data entry is allowed for a particular parameter, regardless of method; in this instance all method rows for the parameter will show the text “disabled” in the “newentry” column.

If you select Option 1, the output will include all of the available information for the parameter-method pairs selected in a tab-delimited output file. The output includes: parameter code, newentry column, parameter short name, parameter long name, a five-character method code, a historical one-character method code, method name, method description, a short citation for the method, a citation description, method source and number, the method precision array, and the method precision array owner. This type of output can be very difficult to read on the screen, so you might consider directing the output to a file for review in another program, such as Excel, when the program queries you for an output destination.

If you select Option 2, 3, or 4, you will receive the information listed in the menu item for your desired parameter-method pairs. You can direct the output to the screen or to a file that you can name for any of these three options.

You can enter the requested parameter-method pairs interactively or by using an input file. The format of the input file is described in [Appendix G](#). Below are the queries when the parameter-method combinations are to be displayed on the screen and are entered interactively.

**Please enter (1,2,3,4, or Q to quit): 1**

**Do you want the output to go to the terminal? (y,n, <CR>=y): y**

**Do you want to retrieve all or selected parameter-method pairs?  
(enter "all" or <CR> for selected):**

**Do you want to enter parameter method pairs from the terminal? (y,n, <CR>=y): y**

**Enter parameter code-method code combinations (<CR> to quit):**

**Method code entry is optional. If method code is not included,  
all method codes will be retrieved for that parameter. e.g.**

**00926**

**00930 PLA11**

**To retrieve a range of parameter codes, enter the following:**

**PCODE - PCODE on one line below. e.g. 00925-00935**

**1: 00915 \_**

**2: 01040 – 01088**

**3: 00940 PLM58**

When you enter selected parameters either from a file or interactively, the following tips might be helpful.

1. If the method code is not included, all method codes for the valid parameter code are included in the output.
2. There must be a space between the parameter and method code. If no space is included, an error message will appear that the input data are not in a valid format.

3. If a **range** of parameters is entered, invalid parameter codes may be used in the range and will be ignored. All valid codes within the range specified will be retrieved. Example:

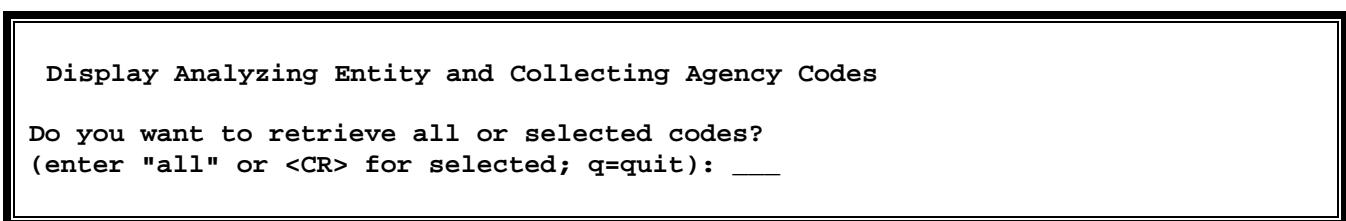

**00025 – 01070**

4. Parameters will be listed in numeric order in the output and are not determined by the order in the input file or the order when entered interactively.

### 3.6.9 Option 9 – Display Analyzing Entity and Collecting Agency Codes

Option 9, Display Analyzing Entity and Collecting Agency Codes, allows you to list the contents of the Protocol Organization Table. The same codes are used for either analyzing entities or collecting agencies. The information available for output from this menu item include: Analyzing Entity and Collecting Agency code, name, and historical fixed value code (prior to NWIS 4.6). A complete listing of this table is available in [Appendix K](#).

When Option 9 is selected, the following menu is displayed.

If you choose to retrieve selected codes, you can enter them interactively or by using an input file. The format of the input file should have one code in each row of the input file. The program will only find those codes that have an exact match in the reference table.

### 3.7 Option 7 – Utilities

The Utilities menu is used to complete several tasks that are not generally part of the common uses of QWDATA.

**QW DATA PROCESSING ROUTINE  
YOU ARE USING WATER-QUALITY DATABASE NUMBER 01**

**Utilities**

- 1 -- Change Data-Base Number**
- 2 -- Add new site or modify site information**
- 3 -- Station Change: Inventory, Change, or Delete**
- 4 -- Count Water Quality Records**
- 5 -- Set Analysis Status Flag**
- 6 -- Set Data Quality Indicator (DQI) Code**
- 7 -- Inventory DQI Codes**
- 8 -- Run qworphan program**
  
- 98 -- Exit menu**
  
- 99 -- Exit system**

**Please enter a number from the above list or a Unix command:**

**Utilities menu options.**

### 3.7.1 Option 1 – Change Database Number

The Change Default Database Number utility allows the user to change the default number for water-quality databases.

### 3.7.2 Option 2 – Add New Site or Modify Site Information

Option 2 is used to add a new site to the NWIS SITEFILE database or to modify the site header information for an existing site. When you select Option 2, you are prompted by software described in Chapter 5 at <http://pubs.usgs.gov/of/2005/1251/>.

Any information you enter is entered into the NWIS SITEFILE database. The output from this entry is collected in a file named “HDRsIN” and is available in your working directory. This input file is also described in Chapter 5 at <http://pubs.usgs.gov/of/2005/1251/>.

### 3.7.3 Option 3 – Station Change: Inventory, Change, or Delete

Instructions for using this program are located in Chapter 12 at <http://pubs.usgs.gov/of/2005/1251/>.

The station change program allows a user with proper access to inventory, delete, or change a station number. The agency code and station number are the primary keys used for identifying locations approved for WRD data collection. An entry in the SITEFILE is required for data stored in the NWIS databases. Updates that affect a station number are applied not only to the SITEFILE, but also to associated databases (QW, GW, ADAPS, and/or Water Use) where data for the site exist. If the program is used to delete a station number in the SITEFILE, the NWIS databases are searched, and data are located in the NWIS that are identified as having been collected at that site will be deleted. The delete transaction in the NWIS is an immediate delete. The only way to recover deleted records is by reentering them. An update to a station number is also performed in the SITEFILE and the associated databases. Updates should be closely coordinated and monitored within your Water Science Center, due to the possibility of affecting data in the NWIS and the national database.

### 3.7.4 Option 4 – Count Water Quality Records

Option 4 is used to count the number of records in the Water-Quality file for selected stations and optionally displays a list of the parameters present in all the analyses. When Option 4 is selected, the following prompts are displayed.

**THIS PROGRAM LISTS THE COUNT OF QW RECORDS FOR A STATION**

**DO YOU WANT A LIST OF PARAMETERS (USING ADDPC) ?**

**DO YOU WANT TO ENTER SITE ID'S FROM THE TERMINAL (YES OR NO) ?**

**DO YOU WANT THE OUTPUT**

**TO YOUR TERMINAL(T) OR TO A FILE(F)?**

**PLEASE ENTER T -- FOR TERMINAL  
OR F -- FOR FILE.**

#### **Program to count Water-Quality records.**

A list of parameters can be included in the output if desired. If you enter the station numbers from the terminal, then you must enter the agency code and station number for each site of interest. If the station numbers are entered from a file, the file format needed is described in [Appendix G](#). If the output is directed to a file, provide a filename.

### 3.7.5 Option 5 – Set Analysis Status Flag

Option 5 is used by the person(s) responsible for water-quality data management to set Analysis Status for samples. Valid Analysis Status codes are described in [Appendix A, Table 5](#). After selecting Option 5, the following submenu is displayed.

qwflag processing in database: 01

Do you want to set the analysis-status code to:

1. Unrestricted (U)
2. Internal-use only (I)
3. Proprietary (P)

Please enter (1,2,3,q): \_

#### **Program to set analysis status flag.**

Usually, the flag is set to “U” to indicate that the sample is unrestricted. Analyses of local interest that are limited to internal uses may have the flag set to “I” to indicate that the sample is complete, but is not to be released to the public. After a selection is made from the submenu above, the program requires entry of record numbers either from the terminal or a file. The records can be identified by record number, or by station number, date, time, medium code, and agency code. If a file is used, the format should be the same as shown in [Appendix G](#).

After successful completion, a message similar to the following will display briefly at the bottom of the screen.

**Summary:**

**Number of records updated: 2**

**Number of records not changed due to matching analysis-status code: 0**

**Number of records skipped due to errors: 0**

### 3.7.6 Option 6 – Set Data Quality Indicator (DQI) Code

Option 6 is used by the person(s) responsible for water-quality data management to set the DQI code. Valid DQI codes are listed in [Appendix A; Table 9](#). The DQI code of “S” is the default setting. After selecting Option 6, the following submenu is displayed.

This program will set the DQI code for a given set of:  
station selection  
date selection  
measurement selection  
DQI remapping scenarios

Do you wish to identify samples by record\_number (Y/N):

**Program for water-quality data management to set the DQI code.**

A “**No**” response will prompt you for station numbers. You can enter record and station numbers on the screen or from a file. The format for input files of station numbers or record numbers is in [Appendix G](#). After station numbers have been entered, you are queried for a range of dates. The date prompts are:

Enter begin sample date/time (time is optional): (yyyymmddhhmm) 20000101  
Enter end sample date/time (time is optional): (yyyymmddhhmm) 200101011200

Time is **optional** when providing the date range; if no time is entered, the software will include all results for the dates entered. If a begin date is entered without an end date, no records will be located. After the sample date range is entered, enter a measurement selection from the following list.

qwdqiflag -- enter measurement selection  
  
You have 3 options:  
1 -- accept all parameters and method codes  
2 -- enter parameters, optionally with method at terminal  
3 -- load parameters, optionally with method from a file

Enter option desired (1-3,<CR>=1):

**Program to enter measurement selection.**

If you select **Option 1--accept all parameters and method codes--** as the measurement method, you will then enter a selection from the eight options listed below. After entering a selection, you must enter a filename for the report that contains the listing of the DQI remappings that will occur. In addition to this output file, a short report of the changes to be made to DQI codes is printed to the terminal. Before any changes are made to any DQI codes, you must verify that the

changes are listed in the output file. Review the report that describes the changes to be made before verifying the remappings.

If you select **Option 2--enter parameters, optionally with method codes--** as the measurement method, the program queries for individual parameter codes and associated method codes. Entering a specific method code is optional. If you do not enter a method code, then all method codes will be included for that parameter. After entering the parameter and method codes, you must make a selection from the eight options listed below. The report that contains the listing of the DQI remappings and updating of DQI codes is the same as described for Option 1.

If you select **Option 3--load parameters, optionally with method from a file--** from the menu above, the program queries for an input file that uses a format described in [Appendix G](#). After entering the filename is entered, you must make a selection from the eight options listed below. The report that contains the listing of the DQI remappings and updating of DQI codes is the same as described for Option 1.

For each of these three options, eight options for DQI remapping scenarios are available as displayed on the following screen.

|                                                     |                                |
|-----------------------------------------------------|--------------------------------|
| <b>qwdqiflag -- select from DQI remap scenarios</b> |                                |
| <b>You have 8 options:</b>                          |                                |
| <b>1 -- Typical records approval:</b>               | <b>OLD=[A/S] =&gt; NEW=R</b>   |
| <b>2 -- In-review records approval:</b>             | <b>OLD=I =&gt; NEW=R</b>       |
| <b>3 -- In-review records rejection:</b>            | <b>OLD=I =&gt; NEW=Q</b>       |
| <b>4 -- Proprietary record identification:</b>      | <b>OLD=[A,S] =&gt; NEW=P</b>   |
| <b>5 -- Proprietary record approval:</b>            | <b>OLD=P =&gt; NEW=O</b>       |
| <b>6 -- Proprietary record rejection:</b>           | <b>OLD=P =&gt; NEW=X</b>       |
| <b>7 -- Systematic rejection:</b>                   | <b>OLD=[A,R,S] =&gt; NEW=Q</b> |
| <b>8 -- User-specified:</b>                         | <b>OLD set =&gt; NEW x</b>     |
| <b>Enter option (1-8, &lt;CR&gt;=1):</b>            |                                |

**DQI remapping scenarios.**

A report containing the selections for changing the DQI codes is prepared for you to review prior to applying the changes. An example of this report is included in [Appendix C](#). It is recommended that you review this report before applying the changes to the DQI values. You can review the report by printing the file or viewing it in a separate window.

**qwdqiflag specifications are complete.**

**A report will be generated listing the remappings that will occur.  
You will be given an opportunity to review that report before the changes are made.**

**Enter name of file to hold report --**

**:dqi\_report**

**The QW tables have been scanned.**

**Number of DQI codes to be changed: 341**

**Number of QW records: 50**

**A detailed report of DQI changes is available in the file--  
dqi\_report**

**Do you want the file spooled (Y/N,<CR>=N)?**

**NOTE! Please review the report before responding to the next query...**

**Do you want to update (Y) or cancel (N) (Y/N,<CR>=N)?**

### 3.7.7 Option 7 – Inventory DQI Codes

Option 7 is used by the person(s) responsible for water-quality data management to check or inventory DQI codes. Valid DQI codes are included in [Appendix A; Table 9](#). When this option is selected, the following queries are presented.

**qwckdqi processing in database: 01**

**Do you want the report to be printed to the screen? (y,n, <CR>=y): n**

**Enter file to hold output: dqi\_rpt.out\_\_\_\_\_**

**Enter water year? (q to quit, <CR>=all): 1970**

**Would you like to restrict your inventory by DQI? (y,n): \_**

If you want to restrict the inventory to specific DQI codes the following queries are presented.

**Do you want to enter DQI codes from the terminal? (y,n, <CR>=y): \_**

**Enter DQI codes (<CR> to quit)**

**1: Q**

**2: \_**

**Would you like to receive a record number file of the DQI codes you selected? (y,n): \_**

**Enter file to hold record numbers:**

**(<CR>=dqi\_rpt.out.recno): \_\_\_\_\_**

**Enter file to hold the parameter names:**

**(<CR>=dqi\_rpt.out.parnames): \_\_\_\_\_**

A “?” entered in the DQI field results in a list of DQI codes and definitions. A <CR> returns you to the screen above.

**DQI codes**

- A -- Historical data**
- S -- Presumed satisfactory**
- I -- Awaiting review**
- R -- Reviewed and accepted**
- Q -- Reviewed and rejected**
- P -- Proprietary, not reviewed**
- O -- Proprietary, reviewed and accepted**
- X -- Proprietary, reviewed and rejected**
- U -- Research or unapproved method/laboratory**

The inventory is completed based on your input for the database number that you are using. An example of the report output is available in [Appendix C](#). The parameter names file will include the following alpha codes in addition to the parameter codes that are part of your inventory request: SAMPL, DBNUM, STAID, DATES, TIMES, and MEDIM.

### 3.7.8 Option 8 – Run qworphan Program

Data relations exist in QWDATA where a record in one table may relate to one or many records in another table. These relations are described as being parent/child relations. When a “parent record” is deleted (or modified, as in the case of station change) from the database, the corresponding “child record(s)” should also be deleted (or modified). When the parent record is deleted, but the corresponding child records are not correctly deleted because of software bugs or improper use of SQL, “orphan records” are created.

The qworphan program allows the NWIS Database Administrator (DBA) to remove orphaned records that no longer belong in the database. The program may be run from a menu, or options may be specified on the command line. This interface gives you the flexibility to monitor qworphan's activity or to run it in an automated fashion, such as a cron job.

The qworphan program has two options. Option 1 deletes orphaned QW records that can be verified from a previously deleted site. Option 1 also provides a report summarizing any other orphaned QW records. Option 2 deletes all orphaned QW records.

The qworphan program operates on your currently selected numbered database.

Choosing Option 8 from the QWDATA utilities menu opens the following menu.

**QW data found.**

**qworphan**

**This program removes Water Quality orphans from the database.**

**Choose from the following options:**

**1 -- Delete orphan records for deleted stations. This option provides  
a report for orphan records with modified or missing site  
information. It is recommended that you run this option first.**

**2 -- Delete all orphan records regardless of site information.  
Warning: there is no way to review your changes or un-do them  
with this option.**

**3 -- Quit qworphan.**

**Please enter 1, 2, or 3:**

#### 3.7.8.1 Option 1 -- Delete Orphan Records for Deleted Stations

If you select Option 1, qworphan writes a message on the screen that it is deleting orphans of deleted sites. Both orphaned sample records and orphaned result records are deleted for sites that have been deleted.

After the orphaned records are removed, qworphan determines how many orphans of remaining sites it found and displays this information. The orphaned records of the remaining sites are not removed from the database using Option 1. The filenames of the output reports are displayed on the screen.

**Output Reports:**

Qworphan produces two reports: the first contains information related to a site's modification and the second contains information pertaining to the records for a particular site. Both reports contain the time they were generated, the user who ran qworphan, and the database number on which it was executed.

The file containing the site modification history is called *qworphan.stnchange.<date/time>*. It contains the station change log information for each station change log entry associated with samples in qworphan. Multiple orphaned records for a site result in one entry for this site in the station history report.

Like the station history program, this report shows both modern and legacy information from the station change log if such legacy information exists on your system. Because of the two different formats, some information will be missing from the older format and this is indicated by dashes.

The file containing a list of sample records is called *qworphan.recno.<date/time>*. This report contains one row for each sample that doesn't match an existing site. The report contains the following information:

- record number + database number (no spaces between),
- database number,
- station number,
- sample begin date/time,
- sample end date/time, and
- medium code.

When viewing this report, please note that the date displayed here is not in the same format displayed by the station change log report. The times are rounded to the nearest minute and converted from UTC to the local time for that sample. The format of the date/time for sample start and end dates is four-digit year, two-digit month, two-digit date, two digit hour, and two-digit minute. For example, a sample with a date of 01-Jan-2004 14:00:00, at a place in Mountain Standard Time zone, shows up as "200401010700." The sample output reports are shown in [Appendix C](#).

If errors occur when the qworphan program is run, these errors will be included in either report. The errors relate to something that was wrong with the database while qworphan tried to write data to the report. Errors that occur while writing the station history information appear in the *qworphan.stnchange.<date/time>* report. Errors that occur while writing the QW sample information will appear in the *qworphan.recno.<date/time>* report. Errors that are serious or that occurred before generating the report are displayed on screen or arrive in email if qworphan was executed as a cron job.

### 3.7.8.2 Option 2 -- Delete All Orphan Records

This option removes all orphaned records from the database. After these records are deleted, the data cannot be recovered. It is highly recommended that you run Option 1 first and inspect the output reports before running Option 2.

Unlike Option 1, Option 2 does not give you any feedback on what during the process. All samples that are no longer associated with a site, including those where the site was modified, are removed from the database. There is nothing indicating how many orphans exist or how many were removed.

Option 2 produces one output file that contains the processing date, the name of the user running the program, and the database number. No other information is shown in this report. The name of this file is *qworphan.delete.errors.<date/time>*. After writing the qworphan delete report, the program displays the name of the delete report and returns to the qworphan menu. As with Option 1, error messages may appear on screen or in email if qworphan was run as a cron job.

### 3.7.8.3 Running qworphan by Using the Command Line

qworphan has a number of command line arguments that can be used to automatically cleanup the database.

- **--db\_no <db\_no>**

<db\_no> is a number from 01 to 99. qworphan can work on only one numbered database at a time. The --db\_no <db\_no> option is recommended when running qworphan interactively.

- **qworphan -1**

This option runs qworphan as if you had selected Option 1, delete orphan records for deleted stations. Its behavior and messages are exactly the same as those of Option 1.

- **qworphan -2**

This option runs qworphan as if you had specified Option 2, delete all orphan records. Its messages and behavior are the same as those of Option 2. The program will not allow you to choose both Option 1 and Option 2 at the same time.

- **--help**

This option tells you how to run qworphan from the command line by showing you this list of options.

#### Examples:

Execute qworphan Option 1, database 01:

**nwis qworphan --db\_no 01 -1**

Execute qworphan Option 2, database 05:

**nwis qworphan --db\_no 05 -2**

Execute qworphan Option 2, database 02:

**nwis qworphan -2 --db\_no 02**

Execute qworphan Option 1, using default database number:

**nwis qworphan -1**

If qworphan is run from a cron job, email is sent every time qworphan runs from this job. This email tells you that qworphan ran, how many orphans it found if the cron ran qworphan with the -1 option, the names of the qworphan reports, the locations of the qworphan reports, and any serious errors that may have occurred during the cron job. These are the messages that normally appear on screen when you run qworphan interactively.

## 3.8 Option 8 – Batch Processing

YOU ARE USING WATER-QUALITY DATABASE NUMBER 01

### Batch Processing

- 1 – Enter batch-file data for logged-in samples (qwcardsin)
  - 2 – Enter batch-file data for all samples (qwenter)
  - 3 – Reload batch-file data, overriding DQI (qwcardsinxrdqi)
  - 4 – Enter batch-file data with user-specified behavior (user-specified modes)
  - 5 – Review tab-delimited batch files
  - 6 – Edit tab-delimited batch files
  - 7 – Produce tab-delimited batch files
- 98 -- Exit menu
- 99 -- Exit system

Please enter a number from the above list or a Unix command:

### **Batch Processing menu.**

The options in this menu work with batch files of water-quality data. Batch files are used for many purposes, such as entering data from the National Water-Quality Laboratory (NWQL) and other laboratories, entering data from another Water Science Center or agency, entering data from a field computer, entering data previously rejected by the batch-loading software, and making large-scale revisions to water-quality data. The most common application is entering data from laboratories.

### Water Quality Data Transfer System

The QW Data Transfer System (QWDX) facilitates the transfer of analytical data from various USGS laboratories to the respective USGS customers or Water Science Centers (WSCs). A laboratory can upload all customers' data to a single spot (the QWDX). A WSC can obtain data from all its laboratories from a single spot (the QWDX), and the data will be in files formatted for batch entry to the QWDATA system. A database administrator should contact the QWDX Administrator to request access (email: GS-W QWDX Admin).

After laboratory data are retrieved from the QWDX server, the files can be batch loaded into QWDATA using one of the programs described below. Automatic retrieval and processing of data from the QWDX server can also be set up on a user-specified schedule (cron job). Further details and instructions are available from within the QWDX system.

## Batch File Format

Pairs of tab-delimited files (typically named ***qwsample*** and ***qwresult***) are used for sample and result information. The pair of batch files contains all of the fields used for database storage of sample-level and result-level data. The related data in the file pair are connected by a “sample integer” generated when the two files are created. Although the sample integer does not have any meaning beyond the batch-file pair, it is critical to keeping the sample and result information properly connected. The sample and result file formats are defined in [Appendix F](#).

The default behavior for the batch input programs is to look for batch files named ***qwsample*** and ***qwresult*** in the directory where the program is initiated. Options 2–4 of the Batch Processing Menu will only use the tab-delimited batch files named ***qwsample*** and ***qwresult*** in the directory where the program is initiated.

## Environmental and Quality-Assurance Databases

Environmental and quality-control (QC) data are entered with the batch-entry programs available in the menu shown above. The batch programs will load the data into the appropriate database based on the sample medium code and the user-selected database. The user-selected database will control which environmental and quality-assurance databases are used during batch processing. A separate internal table named *env\_qa* controls the link between databases designed to contain only environmental or only QC data. This internal table should be set up for use by your local database administrator. If you need help with *env\_qa*, please send email to GS-W Help qwdata. Multiple databases used by NWIS are discussed in [Section 2.11](#).

## Data Entry Behavior

The behavior of the batch-input processes for the tab-delimited files (**Batch Processing menu Options 1–4**) are designed to be used for various tasks. The allowed sample transactions, protected result-level data, and the data types (laboratory and field) that can be updated for Options 1–4 are summarized in the following table.

| <b>Menu option</b>                                                                                     | <b>Modes</b>                       |                                                |                                 |                              |
|--------------------------------------------------------------------------------------------------------|------------------------------------|------------------------------------------------|---------------------------------|------------------------------|
|                                                                                                        | <b>Allowed sample transactions</b> | <b>Results protected from overwrite by DQI</b> | <b>Data that can be updated</b> | <b>Produce ionic balance</b> |
| <b>1</b> Enter data for logged-in samples (qwcardsin)                                                  | Update only                        | Protected                                      | Lab                             | Yes                          |
| <b>2</b> Enter data for all samples (qwenter)                                                          | Any                                | Protected                                      | Lab                             | Yes                          |
| <b>3</b> Reload data overriding DQI (qwcardsinxqdqi)                                                   | Update only                        | Unprotected                                    | Lab                             | Yes                          |
| <b>4</b> Enter data with user-specified behavior <i>Default modes shown may be changed by the user</i> | Any                                | Protected                                      | Lab and field                   | Yes                          |

### **Batch modes for different batch-menu options.**

Most of the entries allowed in the batch-file fields are self explanatory or defined in the domain lists for the coded fields. They are also described in [Section 3.8.4](#) below.

The default setting for allowed sample transactions during specific batch processes is controlled for each NWIS installation by the “qw.conf” file. This file is consulted *only* when the UNIX command line is used with no behavior options specified or when the user-specified behavior ([Section 3.8.4](#)) is used. This file is located at /usr/opt/nwis/data/auxdata/qw.conf and can only be updated by user *nwis*. You may have to contact your local NWIS DBA to update this file. A master version of this file is available at /usr/opt/nwis/data/auxdata/qw.conf.master. To set the default for allowed sample transactions in the “qw.conf” file, add a noncomment line that begins with the text “transaction\_type:,” followed by one or more space characters, then one of the following options.

| Option      | Mnemonic  | Behavior                                                                                                  |
|-------------|-----------|-----------------------------------------------------------------------------------------------------------|
| update_only | QWCARDSIN | Only modification of existing sample records is allowed (including modification and addition of results). |
| add_only    | --        | Only addition of new samples records is allowed.                                                          |
| any         | QWENTER   | Addition, deletion, and modification of sample and/or result records is allowed.                          |
| verify_only | --        | No database updates are allowed.                                                                          |

If the qw.conf file is incorrectly formatted or an invalid option is specified, then the default option is "update\_only."

Batch file programs can also be invoked from the UNIX command line (or cron job). When this approach is used, the behavior options specified on the command line are used. If invoked from the UNIX command line and no behavior options are specified on the command line, then the file named "qw.conf" is consulted to determine the appropriate behavior.

Some "tricks" for using the batch programs might be useful.

1. Set a remark code to "X" to delete a result and all of the associated attributes.
2. To delete value qualifier code(s), set the value qualifier code to "#" in the batch file. For example, to delete value qualifier codes of "aim," the value qualifier code should be "#" in the batch file. A "#" in the value qualifier field will delete all laboratory value qualifier codes but will NOT delete field value qualifier codes (f, e, &, g, j, and k) unless you choose the "field+lab" option in the user-specified batch behavior mode.
3. To delete an entire sample, enter "DELETE" in the aquifer-code field (GUNIT).
4. If a time datum is included in a batch file, the time datum will be updated in the database, but the UTC sample time will not be changed. The result may not be desired, so consider carefully before including a time datum in a batch file. If you want to change the stored time, consider changing the time using [Modify Sample or Results \(Section 3.2\)](#).
5. When including values that require scientific notation, the following format must be used: ##E## for positive exponents and ##E-## for negative exponents.

### Record of Actions Taken (WATLIST)

A record of the actions taken when a batch file is processed with a batch-file program is written to the file named *watlist.yyyymmdd.hhmmss*. The records created, modified, or deleted, the cation/anion balance (if it can be computed), and any error information generated for samples and results are recorded in these files.

The first page of every WATLIST file lists the names of the input batch files, the names of the batch files after processing, the date and time the files were processed, the userid of the person who processed the batch files, any error messages resulting from checksums or file concatenation, the environmental and QA database numbers used during batch processed, the batch modes used during processing, and whether or not an ionic balance was enabled.

The WATLIST for a sample has four main sections and information about a sample is listed in the following order.

1. Sample header information (always printed)
2. Errors, messages, and reports (printed when needed)
  - Sample-level critical failures (rejected samples)
  - Result-level critical failures (rejected results)
  - Sample-level errors
  - Result-level errors
  - Sample-level updates
  - Quality-assurance report
    - a. Chemical verification checks

Results for parameters that are greater than defined USEPA drinking-water alert limits in [Appendix E](#) will be listed here. As of NWIS 4.8, a result with any remark code other than a less-than symbol (<), M, N, or U will be compared to the list of defined limits. If the result is greater than or equal to the defined limit, an error message will appear.

      - A complete list of which verifications and validations are performed is available in Appendix M.
    - b. Cation/anion balance (printed only if the ionic-balance mode is enabled and at least one cation and one anion constituents are present.) [Appendix L](#) lists parameters used in the ion-balance table.

3. Table of results (always printed)

| Attribute                         | Column heading      |
|-----------------------------------|---------------------|
| Result status                     | *                   |
| Parameter code                    | PCODE               |
| Method code                       | MET                 |
| Parameter short name              | PARAMETER NAME      |
| Parameter units                   | UNITS               |
| Result value                      | VALUE               |
| Remark code                       | REM                 |
| Value-qualifier codes (3)         | QUAL CODES<br>1 2 3 |
| Null-value qualifier code         | NVQ                 |
| Data quality indicator code       | DQI                 |
| Rounding code                     | RND                 |
| Analyzing entity                  | ANL-ENT             |
| Laboratory standard deviation     | LSDEV               |
| Reporting level                   | RPLV                |
| Reporting-level type code         | RLCOD               |
| Laboratory preparatory date       | PRP DATE            |
| Laboratory preparatory set number | PREP-SET NO         |
| Laboratory analysis date          | ANL DATE            |
| Laboratory analysis set number    | ANL-SET NO          |

4. Footnotes that define some of the codes (remark, DQI codes, reporting-level codes, value-qualifier codes, method codes, and analyzing-entity codes) used in the table of results.

The first column in the table of results indicates the status of the result and has a column header of “\*.” This one-letter code indicates what happened to that result during the batch processing. For result data that contain updated information, two rows will appear in this section. The first row contains the updated information and prints the entire row as the data are stored in the database with a status of “U.” Immediately following the updated row is a row with status of “P.”

| Code  | Definition                                           |
|-------|------------------------------------------------------|
| N     | New result                                           |
| U     | Updated result                                       |
| D     | Deleted result                                       |
| P     | Previously stored result (before update)             |
| X     | Result transaction failed due to error in input data |
| C     | Calculated result                                    |
| blank | Result already stored and no update was made         |

Samples that are not processed are shown in the WATLIST file and are differentiated from processed samples by a blank record number field and an error message stating why the sample was not processed. The text “Unstored” will be printed where the record number normally appears if the batch verification mode is in effect ([Section 3.8.4](#)). The text “Deleted” will be printed where the record number normally appears if the entire sample is deleted. The WATLIST is automatically sorted by project code. Examples of the WATLIST output can be found in [Appendix C](#).

### Rejected Samples and Results

Samples will be rejected for the following reasons: (a) invalid format, (b) invalid agency code, site ID, dates, times, or medium code, (c) illogical combinations of begin and end dates and times, or (d) results for samples that do not already exist in the water-quality file (except menu options 2 and 4), and the transaction mode selected from the menu does not allow addition of samples. For each sample rejected due to a failure of the input data at the sample level, all results for the sample also are rejected. The sample and result records for the rejected samples are written to batch-format files identical in format to the input file.

Result transactions will be rejected for the following reasons: (a) improper format, (b) invalid code for any of these attributes: parameter code, remark code, method code, or null-value qualifier code, (c) update for a DQI-protected result was not enabled by the batch mode selected, (d) addition of the result would cause more than 500 results for the sample, (e) the value is non-numeric, (f) a null value is not accompanied by a null-value remark or null-value qualifier, (g) a non-null value is accompanied by a null-value remark or null-value qualifier, (h) a negative value for the supplied parameter code is disallowed, (i) an invalid fixed value is supplied for a fixed-value parameter (see [Appendix B](#)), or (j) inappropriate attributes (such as a remark code) are supplied with a fixed-value parameter.

If a single result fails, other results for the same sample will be processed. For each result rejected due to a failure of the input data at the result level, the parent sample record is written along with the rejected result to batch-format files identical in format to the input file.

If no transactions (sample or result) are rejected, no additional batch files are created. The rejected sample and result files can be reprocessed by initiating one of the batch input programs after the files have been corrected.

The files **rejected.sample.yyyymmdd.hhmmss** and **rejected.result.yyyymmdd.hhmmss** are created when samples are rejected from a *qwsample/qwresult* batch-file pair.

A “#” followed by a sample integer is used to insert error messages in the rejected sample and result files. The error message is included before the record causing the error. The format of the error messages in the sample file is:

**#SINT<tab>error message**

The format of the error messages in the result file is:

**#SINT<tab>Result Rejected<tab>Parameter code error message**

These error messages are treated as comments and ignored by the batch input programs. Menu Option 5 to review or Option 6 to edit the tab-delimited batch files will not show the error messages either.

### Command Line Options

**qwbatchinteractive, qwbatchload, qwcardsin, qwcardsinxqdqi, or qwenter**

Allows you to choose what processing program defaults will be used. Note: **If any of the options below are used in conjunction with a program name, the options will overrule the defaults for that program.**

**-data\_to\_update lab, field, or any**

Allows you to select the type of data that can be updated during batch processing. Choices are update lab-only fields (“lab”) or field and lab fields (“field”), or any fields (“any”). “Any” might be used if you wanted the incoming batch file to update any field and not just lab-allowed fields and implies field and lab fields.

**-database NWIS database name**

Allows you to select which NWIS database will be the target of the batch-entered data. This option will likely not be used in a typical NWIS installation.

**-db\_no database number**

Allows you to specify a database number (the default setting is the user's default database or database 01 if the user doesn't have a default database). This might be useful for entering data into an alternate database.

**-dqi\_protection yes or no**

Allows you to knowingly protect or allow updates to results. If the entry is "yes" then results will not be overwritten if the DQI code is ARQOX. Otherwise, the results will be updated.

**-ionic\_balance\_rpt yes or no**

Allows you to suppress the ion balance report in the watlist file.

**-custom\_alerts xx, yy, all**

Allows you to specify a list of custom alert limit files to validate the data against. The list can be the single word "all" to use all files or a comma separated list of file numbers. The custom alert limit files are located at /usr/opt/nwis/data/auxdata/qw\_alert\_limits.

**-tab\_delimited\_files filename(s)**

The list of delimited files containing data to load. Only the sample filenames are to be listed. They must contain "sample" in their filename, as "sample" will be replaced in the search with "result" to locate the corresponding results file. The text "sample" and "result" in the pair of filenames must be in either all upper-case or all lower-case letters.

**-transaction\_type update\_only, add\_only, any, verify\_only, none**

Allows you to set the batch mode to update only to existing records, add only new records to the database, complete any transaction, or only verify the batch file being processed. Using the none option will copy the files and rename them "qwsample" and "qwresult."

**-help      Display a help screen and quit.**

### 3.8.1 Option 1 – Enter Batch-File Data for Logged-in Samples

This option runs ***qwcardsin***, a program that *updates* sample records with sample and result information from tab-delimited batch-file pairs. Thus, an entry for each sample (environmental and QA) must already exist in NWIS.

Generally, ***qwcardsin*** is used to enter the NWQL or other laboratories' transferred data into NWIS. The user will “point” to the appropriate environmental database number. QC data will be separated and written to an associated QA database.

### 3.8.2 Option 2 – Enter Batch-File Data for all Samples

This option runs ***qwenter***, a program that *enters* or *updates* analytical data into NWIS from tab-delimited batch-file pairs. This program is different from ***qwcardsin*** in that a record for a sample does not have to be in the database for the data to be successfully processed.

This program may be used to update existing records with USGS laboratory analytical data, create new records, add analytical data from non-USGS sources, and perform limited editing functions. Use of ***qwenter*** to create records has the potential to create unintended records instead of updating the intended records if there is an error in the key identification fields (site ID, date, time, and medium code). These erroneous records are sometimes difficult to detect and can be time consuming to repair. The appropriate time to use ***qwenter*** is when field crews have been shipping samples from the field without the opportunity to login the samples into NWIS, and a WATLIST is needed to review the laboratory results during the period of time when reruns are still possible. Situations where only new records are intended, such as loading data from another agency, are best handled using the user-specified batch behavior menu option using the setting “Transactions allowed: Only additions of new samples” as discussed in section 3.8.4.

To appropriately use ***qwenter***, the user will “point” to the appropriate environmental database number. QC data will be separated and written to an associated QA database.

### 3.8.3 Option 3 – Reload Batch-File Data, Overriding DQI

This option runs ***qwcardsinxdq***, a program that updates sample records with sample and result information from batch files and overrides any DQI values ([Appendix A, Table 9](#)) that would have protected existing values from update. This program is a modification of the ***qwcardsin*** program, so an entry for each sample (environmental and QA) must already exist in NWIS. The result DQI codes will default to S except for results transmitted with any other DQI code.

Generally, this program will be used to enter reloaded data from the laboratory or other large-scale changes to the water-quality data. The user will “point” to the appropriate environmental database number. QC data will be separated and written to an associated QA database.

### 3.8.4 Option 4 – Enter Batch-File Data with User-Specified Behavior

This option provides an interactive, screen-oriented, batch-precursor program for the expert user to set batch modes. The following screen is displayed when the Batch Processing, Option 4, “Enter batch-file data with user-specified behavior” option, is selected.

**Processing batch updates into environmental database 01, QC database 02**  
**Optional Batch-behavior Modes**

- 1. Filename:** qwsample
- 2. Transactions allowed:**
  - Only updates to samples (QWCARDSIN)
  - Only additions of new samples
  - Any transaction (QWENTER)
  - Verification only, no transactions stored
- 3. Results protected by DQI:**
  - Yes
  - No
- 4. Data that can be updated:**
  - Lab only
  - Lab+Field
- 5. Prepare ionic balance:**
  - Yes
  - No
- 6. Include user-specified alert limits:**
  - Yes
  - No

Select mode to change or <CR> to continue, or ‘Q’ to quit:

The screen displays the environmental and QC database numbers that will be used. The default modes are indicated with an “X” in the menu shown above. You have the option to change the default behavior modes, continue, or exit the program. You can change behavior modes for: the filename, the transactions allowed, whether or not the results are protected by DQI codes, the type of data that can be updated (lab only or lab + field), whether or not an ionic balance is prepared, and whether to compare the results to customized user alert limits. The filename entered must contain the word “sample.”

Some sample and result-level fields are considered “lab” fields. When “Data that can be updated: Lab only” is selected, data that originate with the field office cannot be updated. The following sample-level fields cannot be updated when “Lab only” is selected.

| Column name        | Description                   |
|--------------------|-------------------------------|
| agency_cd          | Agency code                   |
| site_no            | Station identification number |
| sample_start_dt    | Sample start date             |
| sample_end_dt      | Sample end date               |
| medium_cd          | Medium code                   |
| project_cd         | Project code                  |
| aqfr_cd            | Aquifer code                  |
| samp_type_cd       | Sample type                   |
| anl_stat_cd        | Analysis status               |
| hyd_cond_cd        | Hydrologic condition          |
| hyd_event_cd       | Hydrologic event              |
| tissue_id          | Tissue sample identifier      |
| body_part_cd       | Body part code                |
| field_sample_cm_tx | Field sample comment          |
| tz_cd              | Sample time datum             |
| tm_datum_relbty_cd | Time datum reliability code   |
| coll_ent_cd        | Collecting agency code        |

The following result-level field cannot be updated when “Data that can be updated: Lab only” is selected.

|                    |                      |
|--------------------|----------------------|
| field_result_cm_tx | Field result comment |
|--------------------|----------------------|

Additionally, some value-qualifier codes cannot be updated in “Lab only” mode, because they are reserved for use by the WSC’s. Finally, only results having DQI codes of S, I, P, or U are allowed to be updated or written in “Lab only” mode. For more information on value-qualifier and DQI codes, see [Appendix A](#).

The four types of transactions below are allowed.

1. Only updates to samples (qwcardsin). This is the same mode as when the Batch Processing, Option 1, “Enter batch-file data for logged-in samples” option is selected.
2. Only addition of new samples. This is the mode used for the addition of new samples to the database. This option cannot be used for updating existing samples.
3. Any transaction (qwenter). This is the same mode as when the Batch Processing, Option 2, “Enter batch-file data for all samples” option is selected.
4. Verification only, no transactions stored. This capability provides for a “dry run” of the batch program. This mode can be useful for checking data from an external source or for cleaning up data prior to an attempt at storage in the database. The WATLIST created when the program is run with verification mode has the following characteristics.
  - Diagnostic messages generated from the input transactions are printed as usual, with the following exceptions.
  - The sample record number is reported as “Unstored.”
  - When the sample from the batch file is not currently stored: the “Number of parameters” stored is reported as zero and the following message is printed above the listing of results.

=====

**VERIFICATION MODE: NO NEW RECORD CREATED.**

=====

When the samples from the batch file is already stored, the “Number of parameters” printed is the number currently stored. The “Database Number” indicates where the matched stored sample was found, and the following message is printed above the listing of results.

=====

**VERIFICATION MODE: NO UPDATES STORED FOR RECORD NUMBER xxxxxxxx**

=====

Rejected sample and result files are created in verification mode, but these files contain only those records that would have been rejected if the user had attempted to store the data.

To compare the results to one or more user-specified alert limits, set option 6 to “Yes.” The following dialogue will appear:

Enter alert limit file number(s), comma separated, or "all" to use all available files (? to search, <CR>=none): \_\_\_\_\_

If “all” is selected, all valid alert limit files will be used. A list of file numbers selected is echoed to the screen but this list is truncated to eight file numbers. A detailed description of how to use the user-specified alert limit option is in [Section 3.3.5](#).

### 3.8.5 Option 5 – Review Tab-Delimited Batch Files

Option 5, Review tab-delimited batch files, is used to review tab-delimited batch input files. The default filenames are *qwsample* and *qwresult*, but any appropriate filenames may be entered.

The sample and result data are combined and displayed to the terminal screen (T) or saved to a file after the names of the sample-level and result-level tab-delimited batch files are entered. If the files are displayed to the screen, you can set the number of lines displayed at one time. The default number of lines displayed on the screen is 24.

```
qwlistbatch – review TAB-delimited batch input files
Enter pathname of input sample file (<CR>=qwsample, q to quit):
Enter pathname of input result file (<CR>=qwresult, q to quit):
Do you want [132 chars] to terminal (T) or to a file (F) <<CR>=T)
Enter number lines available on screen (<CR>=24):
```

Move through the records on the screen with carriage returns, and enter a “Q” to quit the review.

The combined sample and result data also can be saved to a file (F), and you are prompted for the name of a file to store the formatted sample and result data. The output file format contains the same information as the screen display, the names of the tab-delimited batch files used, and the date the output file was created. The heading information shown below is present at the top of the file output.

```
1Batch Transaction Files -- Processed: 20040520 134647
  Sample: qwsample
  Result: qwresult
```

**Note:** If you enter a “result” filename that contains none or some, but not all of the corresponding results for the “sample” file, then only the matching sample and results data will be displayed. For example, you might try to open an edited result-level file and a nonedited sample-level file. A message such as this is displayed, “One or more result records with no sample record preceding sample: 886918.”

An example output file is shown on the following page.

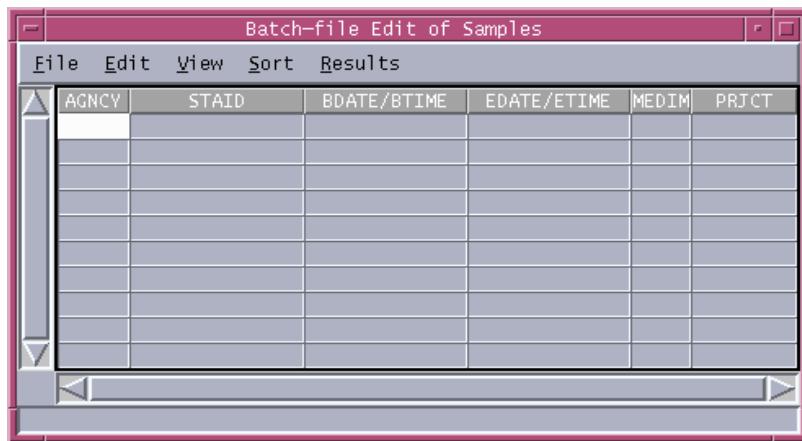

| TRAN NO:             | 1                 | USER   | AGCY     | TIME        |              |            | GEOLOGIC |     |         | BODY      |      |          |                      |
|----------------------|-------------------|--------|----------|-------------|--------------|------------|----------|-----|---------|-----------|------|----------|----------------------|
| SINT                 |                   | CODE   | CODE     | SITE NUMBER | DATUM        | START DATE | END DATE | MED | LAB NO  | PROJECT   | UNIT | PART     | COLLT                |
| 20060427154519000001 | MT                | USGS   | 06305700 |             | 200402031645 |            |          | SB  | 0400023 | 8620DIR05 | U999 |          | USGS-WRD             |
| Sample Field Comment | -- Kinsey, Morgan |        |          |             |              |            |          |     |         |           |      |          |                      |
| Sample Lab Comment   | -- 0400023        | recv'd | 2-07-04  |             |              |            |          |     |         |           |      |          |                      |
| <hr/>                |                   |        |          |             |              |            |          |     |         |           |      |          |                      |
| PARM                 | M                 | E      | R        | VAL         | RPT          | LEV        | RPT      | D   | N       | Q         | V    |          |                      |
| CODE                 | VALUE             | RMK    | T        | D           | LSDEV        | QUAL       | VALUE    | LEV | CD      | I         | Q    | ANL-ENT  | PREP SET #           |
| 00025                | 665               |        |          | 3           |              |            |          |     |         | S         |      | USGS-WRD |                      |
| 00300                | 15.6              | LUMIN  |          | 3           |              |            |          |     |         | S         |      | USGS-WRD |                      |
| 00400                | 7.96              | PROBE  |          | 2           |              |            |          |     |         | S         |      | USGS-WRD |                      |

Example of Review Tab-Delimited Batch Files Output.

### 3.8.6 Option 6 – Edit Tab-Delimited Batch Files

Option 6, Edit tab-delimited batch input files, will bring up a separate window to let the user edit the sample and result data with a spreadsheet-like tool similar to commercial-off-the-shelf spreadsheet applications, including the ability to resize and move windows. The initial batch-editing window is shown in the following image.

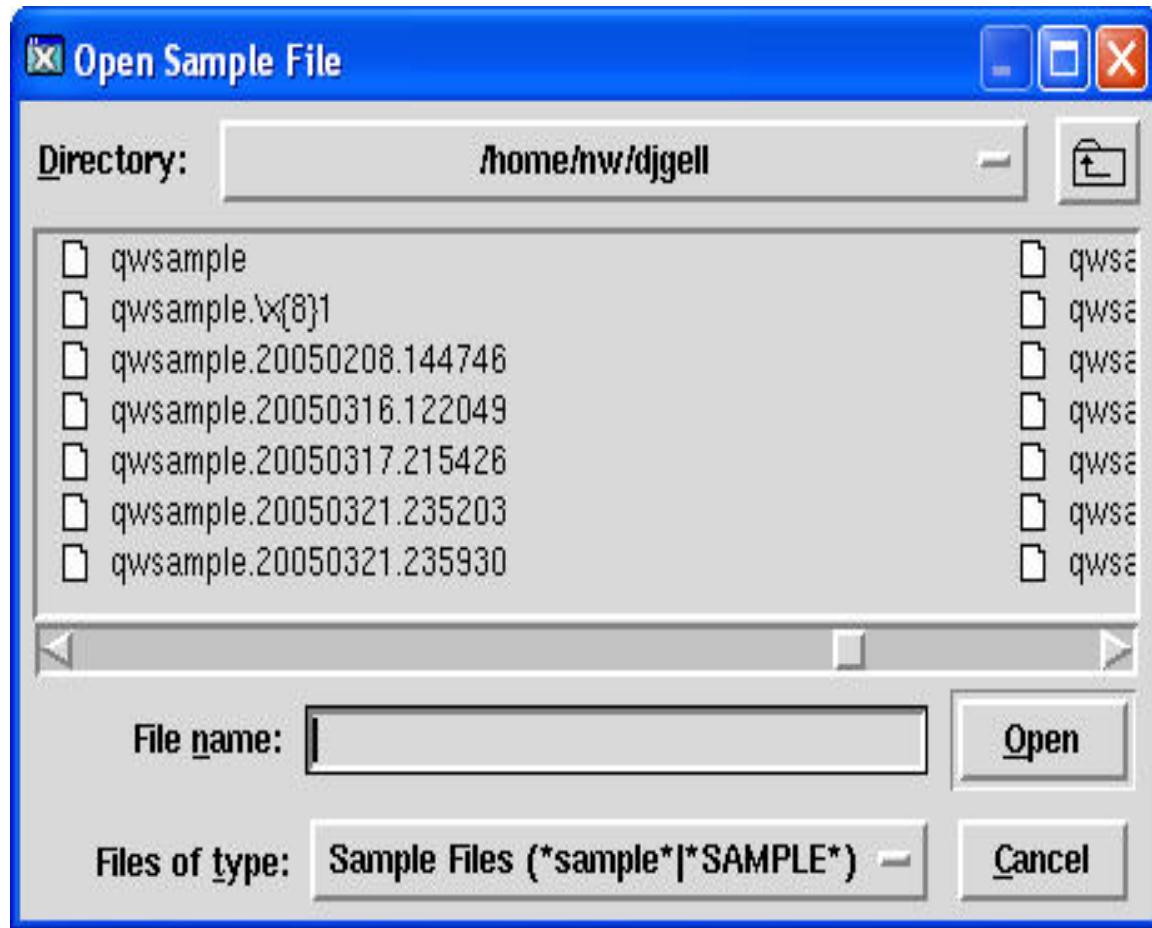

Drop-down menus are available for File, Edit, View, and Sort functions, and displaying the contents in the Results file related to the sample file. **Note: If you experience problems with viewing the drop-down menus near the bottom of your screen, you may have to change your UNIX environment variables.** Submenus for each of these are shown below.

- File
  - New
  - Open
  - Save Samples and Result
  - Save Samples and Results As...
  - Exit
- Edit
  - Undo
  - Redo
  - Find/Replace
  - Cut
  - Copy
  - Paste
  - Insert Row(s)
  - Delete Row(s)

- View
  - A list of all of the column headings is presented for selection
- Sort
  - A list of all of the column headings is presented for selection
- Results
  - For Selected Sample
  - All Results

The program automatically recognizes similarly named, linked pairs of files with names containing the text “**sample**” and “**result**,” although files with other names also can be opened.

Refer to the image below. The button for “Files of type” controls whether only filenames containing the text “**sample**” are displayed or if all filenames are displayed. In the former case, when a sample filename is entered or selected, the program automatically finds and opens a similarly named result file (by looking for similarly named file, swapping the text “**result**” for “**sample**”). In the latter case, the user manually identifies the filename containing the corresponding results. The user may change to a different directory using either of the two buttons adjacent to the word “Directory” at the top of the window.

**Note:** The program has no way to identify any particular file as containing valid batch-format samples or results. The user must ensure that the appropriate filename is supplied. Using an incorrect filename or supplying the filenames in the wrong order can cause the batch editor to behave in a peculiar manner.

Once a file has been selected, the spreadsheet cells are populated, as shown in the following image.

4 samples from /home/nw/djgell/qwsample

One or more samples can be selected by “clicking” on the sample integer (SINT) cell of the desired sample or samples, which highlights the cell. Results for all or selected samples can be chosen, and the results can be displayed in a separate window as shown below.

| <b>Batch-file Edit of Samples</b>              |          |                     |          |       |           |  |

**Note:** If a new result is added to the results file BEFORE a corresponding sample row is entered, the result row will not be saved. Always create the new sample row, before creating new result rows.

Visibility of specific columns in either the sample or results window may be adjusted by selecting the “View” menu. A “tear-away” version of the “View” menu is available by clicking on the dashed line near the top of the expanded “View” menu. This will allow you to keep the column options visible on top of the sample or results windows. Show or hide columns by selecting the box adjacent to the column name. Selections marked with a red square are visible in the active window.

| 27   |        |       |       |       |       |       |       |        |       |

Inserted 21 Row(s)

To use the “Find and Replace All” function in either the sample or result window, click “Edit” then “Find/Replace.” Next fill in the find and replace boxes with your desired changes. Select the column to search and replace by clicking on the column heading. Then click “replace all.”

In the Results window the additional pull-down menu for “Transform” is available and contains the following options:

- Transform
  - Add,
  - Subtract,
  - Multiply,
  - Divide.

At least one cell must be selected in the Results window to select a transform option. In addition to selecting a transform, you must enter a “Numerical Factor,” which is the number you would like to add to, subtract from, multiply by, or use to divide the value in the cell you selected. For example, if you want to add 10 to a result value, you would select the cell, then select “Add,” enter “10” in the “Numerical Factor” field, and select “OK.”

In summary, batch-file editing options in the spreadsheet include:

- Using the mouse cursor to “Point and click” to select rows, columns, or cells;
- Navigation from one cell to the next using the tab or arrow keys;
- Sort columns while still retaining the matching sample integer (SINT);
- Shortcuts are available for use within the batch editor including:
  - Ctrl-c to copy the contents of rows or cells
  - Ctrl-a to select the entire contents of a cell
  - Ctrl-v to paste
  - Ctrl-left (or right) arrow to move within a cell
  - Ctrl-y to repeat the previous action
  - Ctrl-x to cut the contents of cells or rows
  - Ctrl-z to undo the previous action
  - Ctrl-y to redo the previous action
- Search for a string of characters or numbers in the spreadsheet;
- Insert or delete rows in the sample or the results spreadsheet. If a sample row is deleted, the corresponding rows in the results spreadsheet are also deleted.
- Perform simple math calculations on any cell in the results table (add, subtract, multiply, divide) using the “Transform” pull-down menu;
- Files are saved from the sample-level window. If the associated result-level file is open, it should be closed prior to attempting to save the sample-level file.

- Files can be saved after editing or files can be “Saved As” to give files different names. It is important to remember to use a naming convention of “*qwsample.*\_\_\_\_\_” because the corresponding result-level file will automatically be saved with the same extension; and
- The “Exit” command can be used to exit out of spreadsheets without saving.

### 3.8.7 Option 7 – Produce Tab-Delimited Batch Files

This option is used to produce *qwsample* and *qwresult* files from the database. The format of these files is described in [Appendix F](#). The program will use record numbers or agency code, station ID, date, time and medium code to generate the output file. This information can be entered from the terminal or from an existing file. The format of the optional input files is described in [Appendix G](#). If you enter the record numbers interactively, the behavior used is described in [Section 3.3.4](#). Records cannot be retrieved from multiple databases during a single retrieval. If record numbers are in the format #####db, where “db” is the database number, then only records from the selected database will be retrieved. You might not retrieve the records you expect. The output files can be specifically named or defaulted to *qwsample* and *qwresult*.

The local “User Code” ([Section 2.4.21](#)) that is included in the *qwsample* file also may be specified in the *qw.conf* file. On a separate line, enter the key word “customer-code,” followed by one or more spaces, and then enter the default User Code. Set the User Code to the appropriate alphanumeric code for your Water Science Center. For example, an entry for Montana would look like “customer-code: MT.” If a default is not specified in the *qw.conf* file, then \*UNSPECIFIED\* is inserted in the User Code field.

## 3.9 Miscellaneous Programs

Some programs that can be used with QWDATA are available as command line prompts, but the programs are not available from within the QWDATA menus. The programs discussed in this section can be used to manipulate tab-delimited batch files and, by using a batch process, can be used to convert RDB files to Microsoft Excel format and adjust the date-time for stored sample records.

### 3.9.1 Program to Concatenate Tab-Delimited Batch Files (qwcat)

Initiate the program to concatenate multiple pairs of “qwsample” and “qwresult” files into a single file pair by typing the following at the command line prompt:

**qwcat [-q] file1 [ file2 .. fileN ] .**

Where:

“-q” is an optional argument that causes suppression of some of the messages written by the program, and

“file1 file2 fileN” is a mandatory list of filenames for NWIS-QW tab-delimited sample files or a shell-interpreted wildcard string. The list might contain only one filename, which is useful for validating the contents of the batch. The program will determine the filename of each matching NWIS-QW result file by replacing the text “sample” in the sample filename with the text “result.”

An example of this command is:

**qwcat rejected.sample\* ,**

where “rejected.sample\*” is a shell-interpreted wild-card string that matches all files in the current directory that begin with the text: “rejected.sample.”

Output is written to the current directory in files named “qwsample.cat” and “qwresult.cat.” Any existing files of these names are renamed using a current date-time suffix. The qwsample.cat/qwresult.cat files will have sample integers renumbered to 1, 2, 3, etc. The qwresult.cat file will include the results ordered by the parameter code within each sample. The following errors can cause the program to stop.

- No write access to the current directory.
- Inability to rename preexisting output files: “qwsample.cat” and “qwresult.cat.”
- Inability to open files in temporary directory (/tmp or \$TMPDIR).
- Invalid optional argument.
- No valid qwsample filename specified.

The following errors can cause the program to stop processing the batch files.

- qwsample filename does not contain the text “sample.”
- qwsample or qwresult files do not exist in current directory.
- qwsample or qwresult files are not readable by current userid.
- qwsample or qwresult files do not contain text in first 10 bytes.
- qwsample records with duplicative sample integers.
- qwresult records with duplicative combination of sample integer and pcode.
- qwresult record with sample integer not present in qwsample file.

The following can cause unexpected and undesirable behavior.

- Duplicative command-line specification of the same qwsample filename (eg. with wildcards) is silently reduced to one inclusion.
- Batch-file pairs may not be processed in the order entered; they are processed in ASCII sort order by qwsample filenames.
- qwsample records are not sorted within each file; they are added in order of the qwsample file.
- qwresult records are primarily processed in the same order as the qwsample records and secondarily sorted using ASCII sort order by parameter code.
- qwsample and qwresult zero-length records are silently ignored.
- If records exist in qwsample or qwresult files without tab delimiters, they are counted, but ignored. The count of these records is printed.
- qwsample record with sample integer not matching qwresult records is included. The count of such records is printed.
- qwsample and qwresult records with too few tabs are padded (to the right) with empty fields delimited with tabs. The count of such records is printed.
- Program does not track orphaned sample/result messages and they are ignored.
- Including input files that contain “\*.cat” in the filename.

### 3.9.2 Program to Subset Tab-Delimited Batch Files (qwsplit)

You can initiate the program to subset one or more tab-delimited batch-file pairs using project code and (or) station-identification number by using the following:

```
qwsplit [-p fileP] [-s fileS] file1 [ file2 .. fileN ] .
```

Where:

“-p fileP” specifies an optional filename that provides data on how to split the data by project,

“-s fileS specifies” an optional filename that provide data on how to split the data by station, and

“file1 file2 .. fileN” is a mandatory list of one or more tab-delimited batch filenames of sample data. The matching result filenames are assumed to be the same, except the filename text “sample” is altered to “result.”

An example of this command is:

```
qwsplit rejected.sample .
```

If neither a “-p file” nor an “-s file” is supplied, then the program will use all of the project codes found in the qwsample files to subset the data. One pair of subset-data files will be created for each unique project code found in the data. Output files will be named according to the pattern “qwsample.PROJECT” and “qwresult.PROJECT,” where “PROJECT” is a project code found in the data. Data found in the input file(s) without a project code will be associated automatically with the project code “misc,” and thus will be written to files named “qwsample.misc” and “qwresult.misc.”

You can obtain more control over how the data are split by using one or both of the optional split-specification files. Project-split specifications may be supplied in a file named after “-p” on the command line, as in:

```
qwsplit -p qwsplit.projects rejected.sample .
```

Likewise, station-split specifications may be supplied in a file named after “-s” on the command line. Both the “-p” and “-s” command-line options may be used; however, the project-split specifications have precedence over the station-split specifications when both apply to the same sample.

The split-specification files consist of records of which projects or stations belong in separate output files and how those files should be named. In a project-split file, a project-identification number is specified, followed by one or more blank (or whitespace) characters, followed by a filename component. Additional projects may be specified on subsequent lines in the file. The same project should not be specified more than once in the file; however, multiple projects may be assigned to the same filename component. Filename components should not contain blanks (or shell metacharacters, such as “\*” or “?”).

The following is an example project-split file.

|                  |            |
|------------------|------------|
| <b>404000300</b> | <b>bds</b> |
| <b>00300</b>     | <b>bds</b> |
| <b>404039000</b> | <b>jim</b> |
| <b>39000</b>     | <b>jim</b> |

This file would split any “qwsample” records with project code of “404000300” or project code “00300” into a file named “qwsample.bds.” New data will be concatenated onto the end of an existing file. Similarly, “qwresult” records associated with either of these project codes will be concatenated to the end of a file named “qwresult.bds.” All sample and result records with a project code not identified in the project-split file are appended to the files named “qwsample.misc” and “qwresult.misc.”

The station-split file is prepared in the same manner, except that station-identification numbers are presented where project codes appear in the above example.

The following errors can cause the program to stop.

- No write access to the current directory.
- No filename specified afterwards when “-p” or “-s” are on the command line.
- An invalid (unknown) command-line option.
- No qwsample filename is given on the command line.
- Station-split or project-split file specified cannot be opened.
- Inability to concatenate data to a temporary qwsample or qwresult file.

The following errors can cause the program to stop processing the batch files.

- qwsample filename does not contain the text “sample.”
- qwsample or qwresult files do not exist in current directory.
- qwsample or qwresult files are not readable by current userid.
- qwsample or qwresult files do not contain text in first10 bytes.
- qwsample records with duplicative sample integer exist.
- qwresult records with duplicative combination of sample integer and pcode.
- qwresult record with sample integer not present in qwsample file.

The following can cause unexpected and undesirable behavior.

- Duplicative command-line specification of the same qwsample filename (e.g. with wildcards) is silently reduced to one inclusion.
- Warning printed if station-split or project-split file contains records where split data are duplicative or incomplete.
- Zero-length qwsample, qwresult, or split-file records are silently ignored.
- Warning printed of the count of ignored untabbed sample and result records.
- All blanks are removed from project and station-id found in sample records prior to applying subsetting rules.
- Because the program qwcat is used by qwsplit, errors that may cause qwcat to operate incorrectly also apply to qwsplit.

### 3.9.3 Program to Convert 1-and-\* Card Batch Files to Tab-Delimited Batch Files (star2pair)

This program is not part of a usual NWIS installation, and this documentation is included for users' convenience. The program is available by request.

This program will convert a 1-and-\* card batch file to tab-delimited batch files when the following command is entered:

```
star2pair < input file ,
```

where *input file* is the name of the 1-and-\* card batch file to convert.

The program creates tab-delimited files named "qwsample" and "qwresult." If these files exist in the working directory, they are overwritten. **Note: All 1-and-\* card batch files must be converted to tab-delimited batch files beginning with release NWIS 4.8, because the option to process 1-and-\* batch files has been removed.**

Some things you should know about this program are:

- the program does *not verify* the input data;
- the program does syntactically verify the \*-record and the X-record;
- when a syntax failure occurs, the program prints an error message, the line number, and contents of the offensive input record and then continues;
- provides date conversion, case translation, and blank removal;
- provides syntactical conversion of result deletions and null-value qualifiers; and
- provides special handling for the nonstandard syntax used by the NWQL for end-of-file and sample laboratory-identification number (such as P99998).

### 3.9.4 Program to Convert RDB Output Files to Excel Files (rdb2excel)

This package of program and documentation are available by request.

This program is helpful for preparing data retrievals for internal or external users. The program will convert an RDB file to an Excel -workbook file (see version compatibility below) when the following command is entered:

```
rdb2excel rdb_file_name excel_file_name ,
```

where “**rdb\_file\_name**” is the input file and “**excel\_file\_name**” is the output file.

The functions of this program are:

- include RDB comments (in blue) above the column headings;;
- include column names (in red) above the first line of data;
- convert RDB dates to Excel dates, inferred from column-definition specification of [Dd] and actual field length of 10 or less;
- convert RDB date-time to Excel date-time, inferred from column-definition specification of [Dd] and actual field length greater than 10;
- convert RDB text fields to Excel text, inferred from column-definition of [Ss] or "" (null);,
- convert RDB numeric fields to Excel numeric data, inferred from column-definition specification of [Nn];
- convert RDB missing values to Excel missing values and note that one or more blanks is -not- missing;,,
- set column widths using either the wider of column-definition specification or the column-name length;
- enforce the Excel limits on the number of rows/sheet, columns/sheet, and characters/cell;
- name the worksheet within the workbook with the basename of the input RDB file; and
- create an output binary file that when run under UNIX is compatible with Excel versions 5, 95, 97, 2000, and 2003.

Functions intentionally not included in this program are:

- convert the RDB data type of Month (“M”) to anything other than text,
- ensure that a consistent number of fields is present on each line,
- include the column-definition row in the output,
- read/write STDIN/STDOUT (though STDERR is used),
- append to an existing Excel file,
- write Excel formulae,

- convert an Excel file to an RDB file, and
- automatically append an “.xls” suffix to the output filename.

The following conditions will cause errors when running this program:

- failure to specify exactly two command-line arguments,
- too many rows or columns for Excel,
- any RDB column definition other than: [dmns], and
- output file size exceeding 7-MB.

### 3.9.5 Programs for Managing the Display of Water-Quality Data on NWISWeb

Water-quality data can be updated on NWISWeb (<http://waterdata.usgs.gov/nwis>) by using one of two processes: interactive updates or automated processes to upload data on a regular schedule. With either process, you have the option to push a full copy of the NWIS data to NWISWeb, push only the most recent updates, or push all data for one or more sites. Regardless of the method chosen by your WSC, it is advised that you periodically run the **preparation steps outlined below** to help ensure that internal-use-only samples, such as quality-control samples, are not included on NWISWeb and that all NWQL corrections have been applied.

In NWIS, settings at the site, sample, and result levels can be used to prevent certain water-quality data from being displayed on NWISWeb. Data managers can use these settings to indicate that data are either internal-use only or proprietary. At the site level, the site Web code can be used to suppress all data for a site from being displayed on NWISWeb. Details are in the Ground-Water Site Inventory documentation ([Chapter 2; Section 1.39](#)).

The analysis status code in QWDATA can be used to suppress a specific sample from being displayed on NWISWeb. Details about how to change this field are in [Chapter 3.2.3](#) and [Chapter 3.7.5](#). To suppress specific results from being displayed on NWISWeb, use the Data Quality Indicator (DQI) code. Details about how to change this field are in [Chapter 3.2.3](#) and [Chapter 3.7.6](#).

#### Preparation Steps

- Please ensure the NWIS reference lists are up to date.
- Complete all National Water Quality Lab (NWQL) data reloads before proceeding. Load all NWQL reloads in the WSC NWIS database before making the NWISWeb retrievals.

- **Optional Data Check**

A program called *qwwebreport* ([Section 3.9.5.1](#)) has been developed to report which samples and results will be excluded from the NWISWeb retrieval. This program is designed to help the QW Specialist determine if currently excluded data are properly coded in NWIS. Also, this report can be used to screen for data that would be erroneously excluded, enabling corrections to be made prior to the retrieval program execution. This program should be run before the NWISWeb retrievals are made.

### Retrieval Steps

The program *qwreloadout* retrieves water-quality data from QWDATA and refers to transaction logs to incrementally update data on NWISWeb. The commands described in the **retrieval options** invoke this program and send the output to the NWISWeb databases. The process of retrieving a full copy of the NWIS water-quality database by using *qwreloadout* requires little personnel time, but it may require several hours of machine time to complete, so you may want to make the retrieval at the end of the day. An NWISWeb program called *retrieve\_qw\_data* uses the output from *qwreloadout* to transfer the retrieved water-quality data from the NWIS host to the NWISWeb databases.

The retrieval commands retrieve water-quality data from NWIS and use these records to update the water-quality data in the internal aggregated NWISWeb database and the public NWISWeb database. All data in the NWIS databases will be retrieved up to and including the current day. You may choose to update the entire database or update only selected sites.

The following water-quality records will not be displayed on NWISWeb.

- Water-quality data not stored in NWIS database 01
- Samples for sites where the site-web flag is not “Y”
- Samples where the analysis-status code is “I” or “P”
- Samples without a corresponding SITEFILE entry (orphaned records)
- Results with a DQI of {I,O,P,Q,U,X}
- Null results with null-value qualifiers; however, null results with remarks of U,M or N are displayed on NWISWeb
- Parameter code in (71995–71998) and result\_va = 4941
- Parameter code = 72005 and result\_va in (44,46,69,70)
- Parameter codes where the parm\_public\_fg = N

- **Retrieve the entire QW database**

As user nwisweb, perform a full retrieval of all the water-quality data in your NWIS database. This process can run for many hours depending upon the size of your WSC's NWIS QW databases.

```
/usr/opt/nwisweb/sutil/retrieve_qw_data --  
retrieve --full  
--db_no all --quiet &
```

- **Retrieve all records for a single site**

As user nwisweb, run this command for the desired site number and database number:

```
/usr/opt/nwisweb/sutil/retrieve_qw_data --db_no xx --  
site_no USGS 12345678 --retrieve --full ,.
```

where site “**USGS 12345678**” is the agency code and station identification number and “**xx**” is the database number.

- Retrieve all records for a list of sites

As nwisweb, run this command for the desired site number and database number:

```
/usr/opt/nwisweb/sutil/retrieve_qw_data --db_no xx  
--site_list (complete path to filename) --retrieve --full ,
```

Where “**xx**” is the database number and the file looks like this:

|      |                 |
|------|-----------------|
| USGS | 11507501        |
| USGS | 421209121463000 |
| USGS | 420853121505500 |
| USGS | 420615121533600 |
| USGS | 11509370        |
| USGS | 421015121471800 |
| USGS | 420451121510000 |
| USGS | 421257121463600 |
| USGS | 421148121461600 |
| USGS | 420715121541000 |

### 3.9.5.1 *qwwebreport*

The program *qwwebreport* lists the record number of all samples or samples that have results that will be excluded from the file created by the program *qwreloadout*. Specific conditions that result in exclusion of a sample or result within a sample are described in [Section 3.9.5](#). To determine if the samples or results excluded from the NWISWeb dataset are coded properly, review the output from *qwwebreport* before running *retrieve\_qw\_data*. Guidance for reviewing the output is below.

To execute the program, type:

```
qwwebreport > output.filename .
```

The file “output.filename” is your choice of a filename, and this file will contain a report of samples and results that will not be included in the output from the program *qwreloadout*. **Note:** **The qwwebreport program is executed using the user's current NWIS data base setting.** To create a report for another database, select the desired database number before executing the software again. The database number can be specified as described in [Section 3.7.1](#) of QWDATA documentation. An example of the output from this program is in [Appendix C](#).

## 4 APPENDICES

### 4.1 Appendix A. Codes Used in Water-Quality System

| Tables in Appendix A | Description                                 |
|----------------------|---------------------------------------------|
| 1                    | Medium codes (sample level)                 |
| 2                    | Hydrologic condition codes (sample level)   |
| 3                    | Hydrologic event codes (sample level)       |
| 4                    | Sample type codes (sample level)            |
| 5                    | Analysis status codes (sample level)        |
| 6                    | Remark codes (result level)                 |
| 7                    | Primary use of site codes (site level)      |
| 8                    | Primary use of water codes (site level)     |
| 9                    | Data Quality Indicator codes (result level) |
| 10                   | Null value qualifiers (result level)        |
| 11                   | Value qualifier codes (result level)        |
| 12                   | Report level type codes (result level)      |
| 13                   | Alpha parameter codes (NWIS level)          |
| 14                   | Body part codes (sample level)              |

**Table 1. Medium codes.**

[Note: Each environmental medium code has an associated quality-control medium code that is assigned as XXQ, where XX is the environmental medium code]

| Medium Codes     |                 | Description     | Definition                                                                                                                                                                                                                                  | Historic Medium Codes |                 | Default Hydrologic Condition Code | Default Hydrologic Event Code |
|------------------|-----------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|-----------------|-----------------------------------|-------------------------------|
| Environmental    | Quality control |                 |                                                                                                                                                                                                                                             | Environmental         | Quality control |                                   |                               |
| OA               | OAQ             | Artificial      | Any substance that is not part of an aquatic environment and cannot be described by the Sample Medium Codes.                                                                                                                                | A                     | Q               | X                                 | X                             |
| ON               | ONQ             | Not determined  | Not determined.                                                                                                                                                                                                                             | 0                     | --              | A                                 | X                             |
| OB               | OBQ             | Bulk deposition | A mixture of undesignated proportions of wet and dry deposition sampled by a continuously open container.                                                                                                                                   | 8                     | U               | X                                 | 9                             |
| <b>Water (W)</b> |                 |                 |                                                                                                                                                                                                                                             |                       |                 |                                   |                               |
| WS               | WSQ             | Surface water   | Water on the surface of the Earth stored or transported in rivers, streams, estuaries, lakes, ponds, swamps, glaciers, or other aquatic areas. It also may refer to water in urban drains and storm-sewer systems.                          | 9                     | R               | 9                                 | 9                             |
| WG               | WGQ             | Groundwater     | Water below the surface of the Earth contained in the saturated zone. It does not include soil moisture or interstitial water.                                                                                                              | 6                     | S               | X                                 | X                             |
| WW               | WWQ             | Wet deposition  | Water reaching the Earth's surface through precipitation as rain, snow, sleet, hail, or condensation of fog and dew. The water may contain undissolved particulate and gaseous materials acquired from the atmosphere during precipitation. | 7                     | T               | X                                 | 9                             |

|---------------|-----------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|-----------------|-----------------------------------|-------------------------------|
| Environmental | Quality control |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                           | Environmental         | Quality control |                                   |                               |
| WI            | WIQ             | Interstitial water | Water occurring in the small openings, spaces, pores, and voids between particles of unconsolidated materials. Includes water found in the interstices of shallow sediments of a lake, wetland, reservoir, or stream, and in the vadose zone between the root zone and the water table. The water is held in place by entrapment, ionic attraction, and capillary or adhesive forces, rather than from pressure components of saturation. | F                     | Z               | X                                 | X                             |
| WA            | WAQ             | Air moisture       | Water present in air in a gaseous form. Air moisture plays a significant role in weather when it changes from one state to another. These changes include condensation (cloud, fog, dew, and frost) and precipitation (rainfall and snowfall).                                                                                                                                                                                            | N/A                   | --              | X                                 | 9                             |
| WM            | WMQ             | Soil moisture      | Water occupying voids between loose soil particles within the aerated root zone. The water is held in place by surface tension, capillary and hydroscopic forces in opposition to the pull of gravitational forces.                                                                                                                                                                                                                       | K                     | --              | X                                 | 9                             |
| WL            | WLQ             | Leachate           | A solution obtained by passing a liquid (usually aqueous) through an unconsolidated solid medium, thereby dissolving materials (from the solid medium) that become a part of the solution. It also contains those precipitates that are the result of the solution process and subsequent chemical or biological reactions.                                                                                                               | 2                     | =               | X                                 | 9                             |
| WF            | WFQ             | Landfill effluent  | A liquid material (usually water) that is drained or pumped from a landfill. It usually is a liquid that has percolated through solid landfill material to become a transport medium for materials dissolved from the landfill.                                                                                                                                                                                                           | 4                     | --              | X                                 | 9                             |

| Medium Codes      |                 | Description            | Definition                                                                                                                                                                                                                                                                                                                                                                                               | Historic Medium Codes |                 | Default Hydrologic Condition Code | Default Hydrologic Event Code |

| Environmental     | Quality control |                        |                                                                                                                                                                                                                                                                                                                                                                                                          | Environmental         | Quality control |                                   |                               |
| WU                | WUQ             | Elutriation            | A process by which a mixture of an unconsolidated solid medium (usually soil) and a liquid medium (usually water) has been agitated for a given period of time to dissolve materials from the solid. The solid/liquid mixture is finally separated and the resulting solution is analyzed for materials dissolved during the elutriation process.                                                        | 5                     | --              | X                                 | X                             |
| WE                | WEQ             | Effluent               | Treated or untreated wastewater after use at a facility or wastewater treatment plant, or from combined sources, such as combined-sewer overflows or tile drainage systems.                                                                                                                                                                                                                              | %                     | }               | X                                 | 9                             |
| WT                | WTQ             | Treated water supply   | Water after being processed for some particular use(s).                                                                                                                                                                                                                                                                                                                                                  | \$                    | {               | X                                 | 9                             |
| WB                | WBQ             | Untreated water supply | Untreated water supply from a blend of surface and ground waters or from unknown sources.                                                                                                                                                                                                                                                                                                                | N/A                   | --              | X                                 | X                             |
| WH                | WHQ             | Hyporheic zone         | Near-stream subsurface environment where mixing occurs between subsurface water and surface water. Water flows not only in the open stream channel, but also through the interstices of stream-channel and bank sediments, thus creating a mixing zone with subsurface water. There is not a precise separation between groundwater and surface water, thus the hyporheic zone is not precisely defined. | ~                     | >               | X                                 | 9                             |

**Table 4. Sample type codes (sample level).**

| <b>Code</b> | <b>Name</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A           | Not determined   | The sample type was not recorded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| B           | Other QA         | Other quality-assurance samples collected for specific purposes other than regular samples.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| H           | Composite (time) | Composite analyses represent samples collected over a period of time. Compositing minimizes sampling variability or analytical costs for sample group. Concentration and constituent load are assumed relatively constant over the composited time period. Or, concentrations are known to be changing and the composite sample is intended to characterize the event.                                                                                                                                                       |
| 1           | Spike            | A sample to which known quantities of specific (often organic) analytes have been added. Spiked samples are used to monitor the stability of the analytes from the time of the spike to the time of the analysis and to determine the potential bias introduced by the sample matrix. The measured and known concentrations are used to compute percent recovery for each analyte. Recovery rates are compared to potential factors, especially constituent concentrations, to discover causes of variability and (or) bias. |
| 2           | Blank            | A blank sample is prepared from a reference material where none of the analytes of interest are present in detectable quantities. Blank samples are used to determine if environmental samples have been contaminated during the data-collection process. Detection of an analyte in a blank sample that is absent in the blank-source sample indicates bias due to contamination.                                                                                                                                           |
| 3           | Reference        | Reference samples are prepared from an aliquot of reference material. Reference samples are introduced into the data-collection process at various measurement stages to determine bias and variability of the measurement system. Individual sample results are compared to most probable values. Reference-sample results can be used to determine if an analytical process is within expected control limits and whether a project's data-quality objectives are met.                                                     |
| 4           | Blind            | A sample submitted for analysis whose known composition is unknown to the analyst. A blind sample is prepared from a reference material. A blind sample is a particular instance of the reference sample where the identity of the sample is not revealed to the analyzing entity. Blind samples are used to measure the performance of an analytical system, results of more than one laboratory, more than one analytical method, or the consistency of the same laboratory and method over time.                          |
| 5           | Duplicate        | A two-sample instance of a replicate group. The preferred terminology for this type of sample is replicate. One sample is an environmental sample. The companion sample is a quality-control sample.                                                                                                                                                                                                                                                                                                                         |

| <b>Code</b> | <b>Name</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6           | Reference material | Reference material is a general term for a homogenous substance generally prepared by laboratories or chemical suppliers where the concentration of one or more constituents is known. Reference-material samples provide the baseline analytical results for comparison to reference samples. The reference-material sample results are the generally accepted analytical most probable values (MPV). Field users will normally submit reference samples, not reference material samples.              |
| 7           | Replicate          | A member of group of samples collected in a manner such that the samples are thought to be essentially identical. Samples where some part of the measurement process was altered (such as analysis by different laboratories or methods) are termed irrepliicates. Irrepliicates should not be identified as replicates. One group member is an environmental sample and the remaining group members are quality-control samples. Replicate samples are used to describe the variability measurement.   |
| 8           | Spike solution     | A solution with one or more well established analyte concentrations. A spike solution is a specific type of a liquid reference material that is added in known quantities to a known volume of another sample to form a spiked sample. Results for spike-solution samples are stored to describe the known concentrations of the analytes in the spiking solution lot. Spike-solution results are interpreted in conjunction with spiked sample results during the computation of the percent recovery. |
| 9           | Regular            | Sample taken from the environment collected to represent the conditions at a particular place and time.                                                                                                                                                                                                                                                                                                                                                                                                 |

| V                              | value affected by contamination      | Analyte was detected in both the environmental sample and the associated blanks.<br>(see Office of Water Quality Memorandum 97.8) |
| S                              | most probable value                  | Most probable value                                                                                                               |
| R                              | radchem non-detect, below ssLc       | Radiochemistry non-detect, result below sample specific critical level                                                            |
| <b>Null value remark codes</b> |                                      |                                                                                                                                   |
| M                              | presence verified but not quantified | Presence of material verified but not quantified.                                                                                 |
| N                              | presumptive evidence of presence     | Presumptive evidence of presence of material.                                                                                     |
| U                              | analyzed for but not detected        | Material specifically analyzed for but not detected.                                                                              |

**Table 7. Primary use of site codes (site level).**

| <b>Code</b> | <b>Description</b>       | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                |
|-------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A           | Anode                    | Anode is a hole used as an electrical anode. Include in this category wells used solely to ground pipelines or electronic relays and other installations.                                                                                                                                                                                                                        |
| C           | Standby emergency supply | Standby emergency supply refers to a water-supply source that is used only when the principal supplier of water is unavailable.                                                                                                                                                                                                                                                  |
| D           | Drain                    | Drainage refers to the drainage of surface water underground.                                                                                                                                                                                                                                                                                                                    |
| E           | Geothermal               | Geothermal well is a hole drilled for geothermal energy development. Use this category for “dry” geothermal wells or wells into which water is injected for heating. For “wet” geothermal wells, through which water is withdrawn, use “W - withdrawal of water” for the use of site, and “E - power generation” for the primary use of water.                                   |
| G           | Seismic                  | Seismic hole is one drilled for seismic exploration. If it has been converted to water supply, use “W – Withdrawal of water” for the use of site.                                                                                                                                                                                                                                |
| H           | Heat                     | Heat reservoir refers to a well in which a fluid is circulated in a closed system. Water is neither added to, nor removed from, the aquifer.                                                                                                                                                                                                                                     |
| M           | Mine                     | Mine includes any tunnel, shaft, or other excavation constructed for the extraction of minerals.                                                                                                                                                                                                                                                                                 |
| O           | Observation              | Observation well is a cased test-hole or well, drilled for either water-level or water-quality observations. Do not use this category for an oil test hole or water-supply well used only incidentally as an observation well.                                                                                                                                                   |
| P           | Oil or gas well          | Oil or gas well is any well or hole drilled in search of, or for production of, petroleum or gas. It includes any oil or gas production well, dry hole, core hole, injection well drilled for secondary recovery of oil, etc. An oil test hole converted to a water-supply well should be classified as withdrawal (W).                                                          |
| R           | Recharge                 | Recharge site is a site constructed or converted for use in replenishing the aquifer. An irrigation well used to return water to the aquifer during nonpumping periods is a well for withdrawing water, not a drainage or recharge well. Use this category for wells that are used to return water to the aquifer after use, such as those for returning air conditioning water. |
| S           | Repressurize             | Repressurize refers to pumping water into an aquifer in order to increase the pressure in the aquifer for a specific purpose; for example, water flood purposes in oil fields.                                                                                                                                                                                                   |

| <b>Code</b> | <b>Description</b>  | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T           | Test                | Test hole is an uncased hole (or one cased only temporarily) that was drilled for water or for geologic or hydrogeologic testing. It may be equipped temporarily with a pump in order to make a pumping test, but if the well is destroyed after testing is completed, it is still a test hole. A core hole drilled as a part of mining or quarrying exploration work should be in this class.                                                                                                 |
| U           | Unused              | An unused site is an abandoned water-supply site or one for which no use is contemplated. At an abandoned farmstead, a well originally used for domestic purposes may be classed as unused, even though it is equipped with a pump. Similarly, a stock well with a pump may become unused when a pasture or corral is put into cultivation. An irrigation well that is not equipped with a pump, nor used because the yield is too low or the water is too mineralized, belongs in this class. |
| V           | Withdrawal/Return   | Groundwater sites that are used to both withdraw and inject water to a well, such as an irrigation well used to return water to the aquifer during nonpumping periods.                                                                                                                                                                                                                                                                                                                         |
| W           | Withdrawal of water | Withdrawal of water refers to a site that supplies water for one of the purposes shown under use of water. It includes a dewatering well, if the dewatering is accomplished by pumping groundwater.                                                                                                                                                                                                                                                                                            |
| X           | Waste disposal      | A waste-disposal site is one used to convey industrial waste, domestic sewage, oil field brine, mine drainage, radioactive waste, or other waste fluid into an underground zone. An oil test or deepwater well converted to waste disposal should be in this category.                                                                                                                                                                                                                         |
| Z           | Destroyed           | A destroyed site is one that is no longer in existence. The casing of most destroyed wells will be pulled, but some may be plugged or filled. Do not use this category for an abandoned site that merely is not in use.                                                                                                                                                                                                                                                                        |

**Table 8. Primary use of water codes (site level).**

| <b>Code</b> | <b>Description</b>   | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| B           | Bottling             | Bottling refers to the storage of water in bottles and use of the water for potable purposes (see Medicinal).                                                                                                                                                                                                                                                                                                                                                   |
| C           | Commercial           | Commercial use refers to use by a business establishment that does not fabricate or produce a product. Filling stations and motels are examples of commercial establishments. If some product is manufactured, assembled, remodeled, or otherwise fabricated, use of water for that plant should be considered industrial, even though the water is not used directly in the product or in the manufacturing of the product.                                    |
| D           | Dewater              | Dewatering means the water is pumped for dewatering a construction or mining site or to lower the water table for agricultural purposes. In this respect, it differs from a drainage well that is used to drain surface water underground. If the main purpose for which the water is withdrawn is to provide drainage, dewatering should be indicated even though the water may be discharged into an irrigation ditch and subsequently used to irrigate land. |
| E           | Power                | Power generation refers to use of water for generation of any type of power.                                                                                                                                                                                                                                                                                                                                                                                    |
| F           | Fire                 | Fire protection refers to the principal use of the water and should be indicated if the site was constructed principally for this purpose, even though the water may be used at times to supplement an industrial or defense supply, to irrigate a golf course, fill a swimming pool, or for other use.                                                                                                                                                         |
| H           | Domestic             | Domestic use is water used to supply household needs, principally for drinking, cooking, washing, and sanitary purposes, but including watering a lawn and caring for a few pets. Most domestic wells will be at suburban or farm homes, but wells supplying small quantities of water for domestic purposes for one-classroom schools, turnpike gates, and similar installations, should be in the domestic category.                                          |
| I           | Irrigation           | Irrigation refers to the use of water to irrigate cultivated plants. Most irrigation sites will supply water for farm crops, but the category should include wells used to water the grounds of schools, industrial plants, or cemeteries, if more than a small amount of water is pumped and that is the sole use of the water.                                                                                                                                |
| J           | Industrial (cooling) | Industrial cooling refers to a water supply used solely for industrial cooling.                                                                                                                                                                                                                                                                                                                                                                                 |
| K           | Mining               | Mining refers to a water supply used solely for mining purposes.                                                                                                                                                                                                                                                                                                                                                                                                |
| M           | Medicinal            | Medicinal refers to water purported to have therapeutic value. Water may be used for bathing and (or) drinking. If use of water is mainly because of its claimed therapeutic value, use this category even though the water is bottled.                                                                                                                                                                                                                         |

| <b>Code</b> | <b>Description</b>         | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N           | Industrial                 | Industrial use is within a plant that manufactures or fabricates a product. The water may or may not be incorporated into the product being manufactured. Industrial water may be used to cool machinery, to provide sanitary facilities for employees, to air condition the plant, and to irrigate the ground at the plant.                                                                                                                                                                                                                                                                                                                                                                                                        |
| P           | Public supply              | Public Supply use is water that is pumped and distributed to several homes. Such supplies may be owned by a municipality or community, a water district, or a private concern. In most States, public supplies are regulated by departments of health that enforce minimum safety and sanitary requirements. If the system supplies five or more homes, it should be considered a public supply; if four or less, classify use as domestic. Water supplies for trailer or summer camps with five or more living units should be in this category, but motels and hotels are classified as commercial. Most public supply systems also furnish water for a variety of other uses, such as industrial, institutional, and commercial. |
| Q           | Aquaculture                | Aquaculture refers to a water supply used solely for aquaculture, such as fish farms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| R           | Recreation                 | Recreation refers to water discharged into pools (or channels which are dammed downstream to form pools), for swimming, boating, fishing, ice rinks, and other recreational uses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| S           | Stock                      | Stock Supply refers to the watering of livestock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| T           | Institutional              | Institutional refers to water used in the maintenance and operation of institutions such as large schools, universities, hospitals, rest homes, or similar installations. Owners of institutions may be individuals, corporations, churches, or governmental units.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| U           | Unused                     | Unused means water is not being removed from the site for one of the purposes described above. A test hole, oil or gas well, recharge, drainage, observation, or waste disposal well will be in this category. Do not use "off season" or temporary periods of nonuse. The use of water from a newly constructed site should be considered as the use for which it is intended even though it may not yet be in use when inventoried.                                                                                                                                                                                                                                                                                               |
| Y           | Desalination               | Desalination refers to water used in a desalting process whereby dissolved solids are removed to make water potable or suitable for other uses. Enter the type of use of the desalinated water in the next column, "Secondary Water Use."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Z           | Other (explain in remarks) | Other refers to miscellaneous uses not included in the listed categories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

<sup>1</sup> Any DQI-protected value may be overwritten using the following batch processing menu options:

4 -- Reload batch-file data, overriding DQI

5 – Enter batch-file data with user-specified behavior

<sup>2</sup> Used for nonproprietary data in the database at the time of DQI implementation (NWIS 4\_1).

Newly

entered pre-NWIS 4\_1 data should be entered into the database with a DQI code of R or S.

**Table 10. Null-value qualifiers (result level).**

| Null-value qualifiers | Description                                     |
|-----------------------|-------------------------------------------------|
| a                     | Planned measurement was not made.               |
| b                     | Sample broken/spilled in shipment.              |
| c                     | Sample lost in lab.                             |
| e                     | Required equipment not functional or available. |
| f                     | Sample discarded: improper filter used.         |
| i                     | Required sample type not received.              |
| l                     | Analysis discarded: Lab QC failure.             |
| m                     | Results sent by separate memo.                  |
| n                     | Non-performing compound, reasons unknown.       |
| o                     | Insufficient amount of water.                   |
| p                     | Sample discarded: improper preservation.        |
| q                     | Sample discarded: holding time exceeded.        |
| r                     | Sample ruined in preparation.                   |
| u                     | Unable to determine – matrix interference.      |
| w                     | Sample discarded: warm when received.           |
| x                     | Result failed quality assurance review.         |

| ^                            | lab                      | yield outside of contractual acceptable range                        | Yield outside of contractual acceptable range.                                    |
| =                            | lab                      | negative result may indicate potential negative bias                 | Negative result may indicate potential negative bias.                             |

**Table 12. Report level type codes (result level).**

| <b>Report level code</b> | <b>Definition</b>                                | <b>Description</b>                                                                                                                                                                                                                                                                      |
|--------------------------|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRL                      | Minimum Reporting Level                          | Smallest measured concentration of a constituent that can be reliably measured using a given analytical method (Timme, 1995).                                                                                                                                                           |
| MDL                      | Method Detection Limit                           | Minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero. It is determined from the analysis of a sample in a given matrix containing the analyte (U.S. Environmental Protection Agency, 1997). |
| LT-MDL                   | Long-Term Method Detection Limit                 | A detection level derived by determining the standard deviation of a minimum of 24 MDL spike sample measurements over an extended period of time. LT-MDL data are collected on a continuous basis to assess year-to-year variations in the LT-MDL.                                      |
| LRL                      | Laboratory Reporting Level                       | Equal to twice the yearly-determined LT-MDL. At the LRL, the probability of a false negative is less than or equal to 1 percent. The reporting level is set equivalent to the LRL when an analyte is not detected in a sample. (Formerly referred to as Non-Detection Value (NDV)).     |
| IRL                      | Interim Reporting Level                          | A temporary reporting level used for new or custom schedules when LT-MDL data are unavailable and a LRL has not yet been established.                                                                                                                                                   |
| SSMDC                    | Sample-Specific Minimum Detectable Concentration | A reporting level that varies for each sample; primarily used in radiochemical analyses. Radiochemical measurements are not typically censored by the laboratory.                                                                                                                       |
| SSLC                     | Sample-Specific Critical Level                   | The ssLc is the calculated and reported value below which the rad result is considered a non-detect (see <a href="#">Office of Water Quality Technical Memorandum 2008.06</a> ).                                                                                                        |
| Blank                    | ---                                              | A blank report level code should only be stored when no report level is stored. If a report level value is entered, a report level code must also be stored.                                                                                                                            |

| 120                | Fillet muscle plug, skin on     |
| 121                | Fillet muscle plug, skin off    |
| 130                | Plant stem                      |

## 4.2 Appendix B. Fixed Value Codes

### 00028 – ANALYZING AGENCY

The use of the fixed-value code 00028 is not recommended after NWIS 4.5. Instead, please populate the Analyzing Entity field for each result. A detailed description for the use of this code is in [Sections 2.5.10 and 3.2](#). Please see the [Protocol Organization Table](#) for the 8-character alpha codes that can be entered for the Analyzing Entity.

| Value                           | Short name | Description                                                |

\*\*\* QUALITY-ASSURANCE REPORT \*\*\*

\*\*\* Chemical verification checks \*\*\*  
 pH (00400) falls outside of range 4.5 to 9.0

\*\*\* NWIS alert limits \*\*\*  
 Sulfate, wf (00945) is 3140 mg/l, greater than or equals Sulfate SDWR, 250.0 mg/l  
 Manganese, wf (01056) is 80 ug/l, greater than or equals Manganese SDWR, 50.0 ug/l

\*\*\* Custom alert limits \*\*\*  
 Dissolved oxygen (00300) is 3.04 mg/l, less than or equals Dissolved oxygen MTDEQ Aquatic Life, 4.00 mg/l

\*\*\* The cation/anion balance \*\*\*

## Ion Balance Specifications File (Tab Delimited)

### File Format

Line 1: Table Title. This line will begin with “**Title:**”. This title will be used if a custom ion balance file is used to generate an ion balance in output.

Optional lines: Comment lines can be optionally added to the file and are designated by a “#” in column 1. Comment lines can be anywhere in the file and will be ignored by the program.

Subsequent lines: Fields are separated by a “tab” character as shown below.

**Parameter code <tab> Calculated parm flag <tab> MEQ factor <tab> Ion type code <tab> Ion Code <tab> Group code <tab> Ion Row number <tab> Ion preference number <tab> Group preference number <tab> Major ion flag**

### Explanation of fields in file

**Parameter code:** five-digit parameter\_cd

**Calculated parm flag:** Y/N flag to indicate if this is a calculated parameter code

**MEQ factor:** multiplication factor to convert parameter value to milliequivalents per liter

**Ion type code:** A one-character code that indicates the type of ion; "c" indicates a cation and "a" indicates an anion.

**Ion code:** These are the commonly used ions in the ion balance. Upper and/or lower case is acceptable.

#### Cation codes (and definition)

Ca (calcium)

Mg (magnesium)

Na (sodium)

K (potassium)

Fe (iron)

Mn (manganese)

H\_ion (hydrogen ion)

#### Anion codes (and definition)

Cl (chloride)

SO4 (sulfate)

F (fluoride)

ALK (alkalinity; includes acid neutralizing capacity (ANC))

NOx (includes nitrate, nitrite, nitrite plus nitrate)

**Group code:** For alkalinity (ALK) codes and nitrogen (NOx) codes, the group code will be used to define the hierarchy within that ion code. The group codes are:

#### ALK codes:

##### Bicarb (bicarbonate)

Carb (carbonate)

Hydrox (hydroxide)

**NOx codes:**

NO2 (nitrite)

NO3 (nitrate)

NO<sub>2</sub>+NO<sub>3</sub> (nitrite plus nitrate)

For nonstandard ion codes that are not listed above, the user supplies an ion code up to 5 characters long and a group up to 10 characters long

**Ion Row number:** Indicates the order of the row in which this ion appears in the ion balance table, if present.

**Ion Preference number:** Indicates the hierarchy of the ion (lower numbers for the same ion code are preferentially selected).

**Group Preference number:** Indicates the hierarchy of the ions within a group (lower numbers for the same ion code and ion-group code are preferentially selected).

**Major Ion Flag:** Indicates if this parameter code is to be considered a major ion; values are “Y” for major ion, “N” for minor ion.

## Publication Tables (By-sample Format; Four Table Types)

### Table type 1 (single station)

Requested parameters TIMES, MEDIM, ADDPC. User has selected option to ***Display text for fixed values***; default settings accepted for all other options.

### Output File Example from qwwebreport —Continued

Items under “Smpl Exclus” are **sample** exclusions and show either an “X” for Web-flag exclusion or lists of the values of specific fields that will result in exclusion of the entire sample. An explanation of these is shown below.

| Column heading | Description          | Screening                                                                                                                                              |
|----------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEDIUM         | Medium code          | Screening by medium code is not automatic. Rather, all screening by medium code is done by coding the Analysis Status Code to "I" (Internal-use only). |
| Web-flag       | Site web flag        | All but "Y" are excluded ; "X" indicates sample excluded because of web flag                                                                           |
| ASTAT          | analysis status code | All codes = "I" or "P" are excluded.                                                                                                                   |

Items under “Result Exclusions” show an “X” in the column if a **result** is excluded because of parameter code, remark code, data quality indicator (DQI) code, null value qualifier, or Homeland Security screening. Only the screened result is excluded from the sample, unless an item under “Sample Exclusions” is also coded with an excluded code.

| Column heading | Description                 | Screening                                                                                                               |
|----------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------|
| PARM           | Parameter code              | All valid codes are included except those screened for Homeland Security and those flagged for non-public display only. |
| DQI            | Data Quality Indicator code | Results with values = A, R, or S are included                                                                           |

Items under “Result Exclusions” show an “X” in the column if a **result** is excluded because of parameter code, remark code, data quality indicator (DQI) code, null value qualifier, or Homeland Security screening. Only the screened result is excluded from the sample, unless an item under “Sample Exclusions” is also coded with an excluded code.

| Column heading | Description               | Screening                                                                                                  |
|----------------|---------------------------|------------------------------------------------------------------------------------------------------------|
| Null-Qual      | Null value qualifier code | Null results that are qualified with null value qualifiers are excluded. (a,b,c,e,f,i,l,m,n,o,p,q,r,u,w,x) |

| discharge_dt         | Date of recommended discharge (eight chars)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| discharge_tm         | Time of the recommended discharge (six chars)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| discharge_tz_cd      | Time datum of the recommended discharge (six chars)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| data_aging_cd        | Data-aging code of the recommended discharge (two chars)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| value                | The recommended discharge value for the sample (cubic feet per second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| remark_cd            | The remark code of the recommended discharge (two chars)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| suggest_parameter_cd | The recommended QW parameter code for the discharge (five chars). If an instantaneous value is selected, then the suggested parameter code will be “00061”, otherwise parameter code “00060” will be suggested for a daily discharge value.                                                                                                                                                                                                                                                                                                                                      |
| suggest_remark_cd    | The recommended QW remark code for the discharge (one char). If a daily discharge is suggested, and that daily discharge is remarked as “Estimated”, then a QW remark code of “E” (estimated) is suggested.                                                                                                                                                                                                                                                                                                                                                                      |
| suggest_dqi_cd       | The recommended QW data-quality indicator code for the discharge (1 char). If the discharge data-aging status is approved (“A”), then the suggested DQI code is “R” (reviewed and approved). Otherwise, the suggested DQI code is “S” (presumed satisfactory).                                                                                                                                                                                                                                                                                                                   |

## 4.4 Appendix D. Calculated Parameters

The NWIS QWDATA system will produce calculated results during output (qwdata-4) for by-sample-layout retrievals when a calculated parameter or “CALCV” is specified or for by-result-layout retrievals, unless specifically excluded by the user's retrieval options. These calculated results are computed using system-defined algorithms that use the stored results for related parameters. Some algorithms perform simple unit conversions, others compute sums or differences among related constituents, and a few perform complicated chemical logic computations.

The operational steps of the algorithms are stored in an NWIS reference table and are updated periodically. The contents of the reference table can be listed using a “Support Files” menu option (qwdata-6-7). The following UNIX command may be used to list the parameters with algorithms (substitute the appropriate database name for *nwisdb*).

```
tsql nwisdb "select distinct a.parm_cd, parm_ds from parm a, alg b  
where a.parm_cd = b.parm_cd"
```

Many of the algorithms optionally can employ one of several candidate parameters within the calculation. The plethora of different pathways through the algorithms makes documentation of each algorithm complex, and sometimes makes it difficult to understand how a particular calculated result was determined.

The QWDATA system provides a capability to produce a “trace” of all the algorithm computational steps that were performed during a retrieval. The trace output can be used to ascertain how the software produced each calculated result.

The QWDATA algorithm-processing software performs computations using a “stack” of results. This technique, often referred to as “Reverse Polish Notation” (RPN), is a mechanism for stacking up intermediate results so they can be used in subsequent computations. When results are entered or computed, the size of the stack of intermediate results stays the same, grows by one, or shrinks by one, as required by the operations being performed. Each step will involve one or two of the most recently processed results. The QWDATA algorithm stack includes a remark code, value, and data-quality indicator (DQI) code for each entry.

### Procedure to Trace Algorithms

- 1. Set environment variable:** At the UNIX “shell” command prompt, set the environment variable named **QWTRACEALG** to the name of the file to contain the trace output. The syntax for setting an environment variable depends on the UNIX shell. If you do not know which shell you are using, type the following:

```
echo $SHELL .
```

**Table 1.--Syntax for setting and clearing the algorithm-trace environment variable for various UNIX shells.**

[Do NOT put these commands into UNIX login scripts.]

| <b>UNIX shell</b>    | <b>Setting environment</b>                                | <b>Clearing environment</b>          |
|----------------------|-----------------------------------------------------------|--------------------------------------|
| sh (Bourne)          | <code>QWTRACEALG=filename.gz<br/>export QWTRACEALG</code> |                                      |
| ksh (Korn-shell)     | <code>export<br/>QWTRACEALG=filename.gz</code>            | <code>unset QWTRACEALG</code>        |
| bash (bash-shell)    |                                                           |                                      |
| csh (C-shell)        | <code>setenv QWTRACEALG<br/>filename.gz</code>            | <code>unsetenv<br/>QWTRACEALG</code> |
| tcsh (TENEX C-shell) |                                                           |                                      |

**Run retrieval:** Use one of the tabling options in Output menus (qwdata-4) to produce the desired retrieval. In addition to the output file generated by the retrieval, a compressed text file with a trace of all the computations performed will be written to the pathname specified by the trace environment variable. (The batch-entry and data-verification menu options can also produce trace output that shows the computational steps for the calculated parameters that appear on the WATLIST report.)

2. **Clear environment variable:** Use an appropriate “clearing environment” command (table 1) to stop generating trace output during subsequent QWDATA retrievals.
3. **Interpret trace output:** Uncompress and inspect the contents of the algorithm-trace file. The following UNIX commands in a pipeline will display the trace-file contents to the screen page-by-page.

```
gzcat filename.gz | more
```

The trace output consists of a header that identifies the QWDATA program and run date. Each computation is identified with a record number, database number, and the computed parameter. Then, the computational steps are listed in the order executed. Each step shows the algorithm operator (table 2), and (depending on the operator) an operand and textual comment, along with the stack contents after the step was performed.

**Table 2.--Algorithm operators.**

| <b>Operator code</b>        | <b>Description</b>                                                                                                                                                                                                                                                      | <b>Effect on stack</b> | <b>Operand</b>    |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-------------------|
| <b>Arithmetic operators</b> |                                                                                                                                                                                                                                                                         |                        |                   |
| +                           | Addition of upper- and lower-stack results.                                                                                                                                                                                                                             | -1                     | none              |
| -                           | Subtract lower- from upper-stack result.                                                                                                                                                                                                                                | -1                     | none              |
| *                           | Multiply upper- and lower-stack results.                                                                                                                                                                                                                                | -1                     | none              |
| /                           | Division of upper- by lower-stack result.                                                                                                                                                                                                                               | -1                     | none              |
| **                          | Exponentiate: Raise upper- to the power of lower-stack result.                                                                                                                                                                                                          | -1                     | none              |
| <b>ln</b>                   | Natural log of lower-stack result.                                                                                                                                                                                                                                      | 0                      | none              |
| <b>max</b>                  | Use maximum of upper- and lower-stack results.<br>The remark and DQI codes of the selected entry are output.                                                                                                                                                            | -1                     | none              |
| <b>zero&lt;0</b>            | Censor lower-stack result to zero when negative.<br>If remark is “>” and value < 0: set to “>0.”<br>If remark is not “>” and value <=0: set to “e0.”<br>DQI code is unchanged.                                                                                          | 0                      | none              |
| <b>Stack operators</b>      |                                                                                                                                                                                                                                                                         |                        |                   |
| <b>Push</b>                 | Put a stored parameter result onto the stack.<br>If the result is not found, DQI is Q or X, or value is null: a missing result is placed on the stack.                                                                                                                  | +1                     | result<br>parm_cd |
| <b>ReqPush</b>              | Put a stored parameter result onto the stack.<br>If the result is not found, DQI is Q or X, or value is null:<br>abort the computation.                                                                                                                                 | +1                     | result<br>parm_cd |
| <b>PushUncens</b>           | Get an uncensored stored parameter result.<br>If the result is not found, DQI is Q or X, or value is null: a missing result is placed on the stack. If the remark is “<”: the result is set to an unremarked zero. Otherwise, the stored result is placed on the stack. | +1                     | result<br>parm_cd |
| <b>ConstPush</b>            | Put a constant value onto the stack. (Constants are assigned a special DQI code of “#” to distinguish them from measured values.)                                                                                                                                       | +1                     | float             |

| Operator code                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Effect on stack | Operand              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|----------------------|
| <b>GetMEQ</b>                  | Put the milliequivalent (MEQ) factor for the specified parameter code from ion_bal reference table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | +1              | ion_bal<br>parm_cd   |
| <b>Calc</b>                    | Put the result for another calculated parameter onto the stack. The user-specified output-precedence rules govern whether this result is stored or calculated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | +1              | algorithm<br>parm_cd |

| <                              | Set lower-stack result to missing if less than upper result.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | -1              | none                 |

(The “lower-stack result” refers to the result most recently placed on the stack. The “upper-stack result” refers to the result placed on the stack prior to the lower-stack result. Any result with a DQI of “Q” or “X” (reviewed and rejected) is treated as missing. Any operation that generates an overflow, an underflow, or an undefined result places a missing value on the stack. If the operator requires one operand (eg. ln) and the operand is a missing result or a null-valued result, then the output of the operation is a “missing” result. If an operator requires two operands to

complete the operation, but either operand is missing or null-valued, the result from that operator is a “missing” result. “Effect on Stack” indicates the addition(+1) or removal(-1) of a value on the stack.)

**Footnotes:** Operations that involve a result(s) with a less-than or greater-than remark code(s) (“<” or “>”) follow rules that govern inequalities. Operations involving two results not qualified with inequality-remark codes yield a result with the remark code that is first in the hierarchy: (V, R, E, A, S, or *blank*). Operations involving two results yield the DQI code that is first in the hierarchy: (X, P, O, U, Q, I, S, A, R, or #), except as noted above.

### Example Trace of a Sodium Adsorption Ratio Computation

The equation for the sodium adsorption ratio is below.

```
(Na * 0.0435)
SAR = -----
          SQRT [ { (Ca * 0.0499) + (Mg * 0.08229) } / 2 ]
```

An example trace of the computation is below, with annotations in blue.

```
Program: qwtable                               Date: 03-10-2010 09:31
=====
Record number: 99503349                         DB_no: 01
```

Parameter code: 00931 Sodium Adsorption Ratio **Parameter being calculated**

**Step: 1 Operation:** ReqPush Operand: 00930 Sodium, wf, mg/l  
Load: Sodium, wf, Exit if missing  
----- RPN stack -----  
RMK Value DQI  
< 0.200000000 A **Sodium is censored**

**Step: 2 Operation:** GetMEQ Operand: 00930 Sodium, wf, mg/l  
Load Na meq

Set to missing if result < 0  
----- RPN stack -----  
RMK Value DQI  
< 0.033236031 A

## 4.5 Appendix E. EPA Drinking-Water Alert Limits

Parameter codes that are allowed for new data entry are compared to the [EPA primary and secondary drinking water standards](#). Parameter codes that match any of the EPA regulated constituents are listed in this table and are included in the NWIS alert limit file. Exceptions are parameters with names that indicate the results are calculated, estimated by regression parameters, or are constituent loads.

In some cases, a parameter may represent one or more alert limits (e.g. nitrate + nitrite) or may represent one constituent in an EPA standard that has multiple constituents (e.g. chloroform, which is a component of the EPA's total trihalomethane standard). The NWIS alert in these cases is the greater of the applicable EPA standards.

[MCL, maximum contaminant level; MRDL, maximum residual disinfectant levels; TT, treatment technique; SDWR, secondary drinking water regulations]

| Parameter code                                              | Parameter name | Alert limit (concentration in mg/L, unless otherwise noted) | Alert limit type (MCL, unless otherwise noted) |
|-------------------------------------------------------------|----------------|-------------------------------------------------------------|------------------------------------------------|

## 4.6 Appendix F. Format for Batch Input of Data

The batch-file format for input of data into the water-quality system was established in NWIS 4.1. The previous format used “1 and \* card” images (See [Open-File Report 89-617](#), p. 4–7 to 4–9, for a description). The format uses two tab-delimited files. One file contains sample-level information including a sample integer (**SINT**) that is used only to link file records between the two files. The second file contains the results and all of the result-level attributes. In the case of null values, the tabs must be provided (i.e., <TAB><TAB>). For all fields except value qualifiers and null-value qualifiers, entries will be changed to uppercase during the batch entry process. Examples are included in this appendix as a reference for those users who will be entering data by batch.

| Sample-level information batch-file format |                 |                                                                                     |                    |                  |                                                                                                   |
|--------------------------------------------|-----------------|-------------------------------------------------------------------------------------|--------------------|------------------|---------------------------------------------------------------------------------------------------|

\* -- Laboratory value-qualifier codes can be overwritten during batch. Field value-qualifier codes (f, e, &, g, j, and k) cannot be overwritten during batch unless the “field+lab” option in the user-specified batch behavior mode is chosen.

Tab-delimited batch-file pairs (qwsample and qwresult), are difficult to review on the screen without using the batch review or batch editor programs. To view an example of the batch-file pair see the rejected.\* files displayed in [Appendix C](#). The examples below are a batch-file pair that has been reformatted for this document.

#### Sample-level batch file format example

## 4.7 Appendix G. Format for Input Files

| Section                       | Description                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------|
| 3.2.1                         | Format required for field forms                                                               |
| 3.3.1.1, 3.7.6                | Station identification numbers for retrieval                                                  |
| 3.3.4, 3.4.3,<br>3.4.7, 3.7.6 | Record number file for retrieval                                                              |
| 3.3.4, 3.4.7                  | Station identification number, sample date, sample time, and sample medium code for retrieval |
| 3.3.5                         | Format required for user-specified alert limit files                                          |
| 3.4.3.3, 3.6.7,<br>3.7.6      | Parameter code file                                                                           |
| 3.4.3.4                       | Censoring of zero values                                                                      |
| 3.4.3.4                       | Recensoring of stored values                                                                  |
| 3.4.7                         | Custom output-rounding file                                                                   |
| 3.4.7                         | Custom output-column-heading file                                                             |
| 3.6.8                         | Parameter codes for parameter-method table retrieval                                          |

### Format Required for Field Forms

[Lines that begin with a “#” are comment lines that can be inserted at the beginning of the field form. The first line with a “#” will be the name of the field form shown when field forms are listed to the screen. These comment lines are optional]

|       |                                                                                  |
|-------|----------------------------------------------------------------------------------|
| 1–5   | Parameter code                                                                   |
| 6–10  | Method code (optional—five characters)                                           |
| 12–36 | Parameter names or descriptions                                                  |
| 40    | “Y” indicates that parameter is mandatory                                        |
| 42–49 | Analyzing entity code (eight-character code; see Appendix K for allowed entries) |

### List of Station Identification Numbers for Retrieval

[Station number must be left justified]

| Column | Description    |
|--------|----------------|
| 1–5    | Agency code    |
| 6–20   | Station number |

### Record Number File Format for Retrievals

| Column | Description                                            |
|--------|--------------------------------------------------------|
| 1–8    | Record number                                          |
| 9–10   | Database number (if multiple databases are being used) |

**List of Station Identification Number, Sample Date, Sample Time, and Sample Medium Code**

[Station number must be left justified]

| Column | Description                   |
|--------|-------------------------------|
| 1–5    | Agency code                   |
| 6–7    | [not used]                    |
| 8–22   | Station number                |
| 23–46  | Sample date                   |
| 23–26  | Begin year (YYYY)             |
| 27–28  | Begin month (MM)              |
| 29–30  | Begin day (DD)                |
| 31–34  | Begin time (2400 hour system) |
| 35–38  | End year (YYYY)               |
| 39–40  | End month (MM)                |
| 41–42  | End day (DD)                  |
| 43–46  | End time (2400 hour system)   |
| 47–49  | Medium code                   |

**Format Required for User-Specified Alert Limit Files**

[The fields in this file must be separated with a tab character. Lines that begin with a “#” are comment lines that can be inserted at the beginning of the user-specified alert limit file. The first line of the alert limit form should be used to document the purpose of the alert limit form by placing a “#” in the first column. Additional lines can be used for comments if a “#” is in the first column.]

| Description                                  | Column-width |
|----------------------------------------------|--------------|
| Parameter code                               | 5            |
| Comparison operator (one of: GT, GE, LT, LE) | 2            |
| Numeric comparison                           | No limit     |
| Text description                             | No limit     |

**Example**

```
#Title: Florida Department of Environmental Regulation Class III Waters
00950 <tab> GE <tab> 2.0 <tab> Fluoride FLDEP Aquatic Life
00300 <tab> LE <tab> 4.0 <tab> Dissolved Oxygen FLDEP Aquatic Life
34513 <tab> GT <tab> 5.0 <tab> 1,1,2-Trichloroethane NAWQA HBSL
```

### Parameter Code File

| Column | Description                 |
|--------|-----------------------------|
| 1–5    | Parameter code              |
| 6      | (Not used)                  |
| 7–11   | Method code (if needed)     |
| 12–80  | Parameter name (if desired) |

### Format of File for Censoring of Zero Values:

| Column | Description       |
|--------|-------------------|
| 1–5    | Parameter code    |
| 6–14   | Recensoring value |

### Format of File for Recensoring Information:

| Column | Description             |
|--------|-------------------------|
| 1–5    | Parameter code          |
| 6–10   | Method code (if needed) |
| 11–19  | Recensoring value       |

### Format of Custom Output-Rounding File:

| Column | Description                                                                   |
|--------|-------------------------------------------------------------------------------|
| 1–5    | Parameter code                                                                |
| 6      | (Not used)                                                                    |
| 7–11   | Method code (optional)                                                        |
| 12     | (Not used)                                                                    |
| 13     | Rounding code (one of: D, U, or N to indicate Default, User-defined, or None) |

### Format of Custom Output-Column-Heading File:

| Column  | Description                   |
|---------|-------------------------------|
| 1–5     | Parameter code                |
| 6–175   | Parameter column heading text |
| 176–325 | Table headnote definition     |

**Parameter Codes for Parameter-Method Table Retrieval:**

| <b>Column</b> | <b>Description</b>                                                          |
|---------------|-----------------------------------------------------------------------------|
| 1–5           | Parameter code                                                              |
| 6             | (Not used)                                                                  |
| 7–11          | Method code (optional)                                                      |
| 12            | (Not used)                                                                  |
| 13            | Dash (optional—required if retrieving a range of parameter codes)           |
| 14            | (Not used)                                                                  |
| 15–19         | Parameter code (optional—required if retrieving a range of parameter codes) |
| 20            | (Not used)                                                                  |
| 21–25         | Method code (optional)                                                      |

## 4.8 Appendix H. Parameters that Allow Negative Values

| Parameter code | Parameter name                                                                                                                            |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 00001          | Location in cross section, distance from right bank looking upstream, feet                                                                |
| 00002          | Location in cross section, distance from right bank looking upstream, percent                                                             |
| 00009          | Location in cross section, distance from left bank looking downstream, feet                                                               |
| 00010          | Temperature, water, degrees Celsius                                                                                                       |
| 00011          | Temperature, water, degrees Fahrenheit                                                                                                    |
| 00012          | Evaporation temperature, 48 inch pan, degrees Celsius                                                                                     |
| 00013          | Evaporation temperature, 24 inch pan, degrees Celsius                                                                                     |
| 00014          | Wet bulb temperature, degrees Celsius                                                                                                     |
| 00020          | Temperature, air, degrees Celsius                                                                                                         |
| 00021          | Temperature, air, degrees Fahrenheit                                                                                                      |
| 00042          | Altitude, feet above mean sea level                                                                                                       |
| 00055          | Stream velocity, feet per second                                                                                                          |
| 00056          | Flow rate of well, gallons per day                                                                                                        |
| 00058          | Flow rate of well, gallons per minute                                                                                                     |
| 00059          | Flow rate, instantaneous, gallons per minute                                                                                              |
| 00060          | Discharge, cubic feet per second                                                                                                          |
| 00061          | Discharge, instantaneous, cubic feet per second                                                                                           |
| 00062          | Elevation of reservoir water surface above datum, feet                                                                                    |
| 00065          | Gage height, feet                                                                                                                         |
| 00072          | Stream stage, meters                                                                                                                      |
| 00090          | Oxidation reduction potential, reference electrode not specified, millivolts                                                              |
| 00149          | Alpha-emitting isotopes of radium, water, filtered, picocuries per liter                                                                  |
| 00400          | pH, water, unfiltered, field, standard units                                                                                              |
| 00401          | Cations minus anions, water, milliequivalents                                                                                             |
| 00403          | pH, water, unfiltered, laboratory, standard units                                                                                         |
| 00409          | Acid neutralizing capacity, water, unfiltered, Gran titration, microequivalents per liter                                                 |
| 00410          | Acid neutralizing capacity, water, unfiltered, fixed endpoint (pH 4.5) titration, field, milligrams per liter as calcium carbonate        |
| 00411          | Acid neutralizing capacity, water, unfiltered, methyl orange endpoint (pH 3.1-4.4) titration, milligrams per liter as calcium carbonate   |
| 00413          | Acid neutralizing capacity, water, unfiltered, Gran titration, milligrams per liter as calcium carbonate                                  |
| 00415          | Acid neutralizing capacity, water, unfiltered, phenolphthalein endpoint (pH 8.5-9.0) titration, milligrams per liter as calcium carbonate |
| 00416          | Acid neutralizing capacity, water, unfiltered, incremental titration, laboratory, milligrams per liter as calcium carbonate               |
| 00417          | Acid neutralizing capacity, water, unfiltered, fixed endpoint (pH 4.5) titration, laboratory, milligrams per liter as calcium carbonate   |
| 00418          | Alkalinity, water, filtered, fixed endpoint (pH 4.5) titration, field, milligrams per liter as calcium carbonate                          |
| 00419          | Acid neutralizing capacity, water, unfiltered, incremental titration, field, milligrams per liter as calcium carbonate                    |
| 00421          | Alkalinity, water, filtered, fixed endpoint (pH 4.5) titration, laboratory, milligrams per liter as calcium carbonate                     |

| Parameter code | Parameter name                                                                                                                        |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 00431          | Acid neutralizing capacity, water, unfiltered, milligrams per liter as calcium carbonate                                              |
| 00435          | Acidity, water, unfiltered, milligrams per liter as calcium carbonate                                                                 |
| 00436          | Mineral acidity, water, unfiltered, methyl orange endpoint (pH 3.1-4.4) titration, milligrams per liter as calcium carbonate          |
| 00437          | Carbon dioxide acidity, water, unfiltered, phenolphthalein endpoint (pH 8.5-9.0) titration, milligrams per liter as calcium carbonate |
| 01501          | Alpha radioactivity, water, unfiltered, picocuries per liter                                                                          |
| 01503          | Alpha radioactivity, water, filtered, picocuries per liter                                                                            |
| 01505          | Alpha radioactivity, suspended sediment, picocuries per liter                                                                         |
| 01515          | Gross alpha radioactivity, water, filtered, natural uranium curve, picocuries per liter                                               |
| 01516          | Gross alpha radioactivity, suspended sediment, natural uranium curve, picocuries per liter                                            |
| 01519          | Gross alpha radioactivity, water, unfiltered, picocuries per liter                                                                    |
| 03501          | Beta radioactivity, water, unfiltered, picocuries per liter                                                                           |
| 03503          | Beta radioactivity, water, filtered, picocuries per liter                                                                             |
| 03505          | Beta radioactivity, suspended sediment, picocuries per liter                                                                          |
| 03515          | Gross beta radioactivity, water, filtered, Cs-137 curve, picocuries per liter                                                         |
| 03516          | Gross beta radioactivity, suspended sediment, Cs-137 curve, picocuries per liter                                                      |
| 03519          | Gross beta radioactivity, water, unfiltered, Cs-137 curve, picocuries per liter                                                       |
| 03521          | Carbon-13/Carbon-12 ratio in organic fraction, soil or rock, per mil                                                                  |
| 03522          | Sulfur-34/Sulfur-32 ratio in sulfide, water, filtered, per mil                                                                        |
| 03523          | Sulfur-34/Sulfur-32 ratio in sulfide, bed sediment, per mil                                                                           |

| 29975          | Tellurium-132, water, unfiltered, picocuries per liter                                                                     |
| 29977          | Tellurium-132, water, filtered, picocuries per liter                                                                       |
| 29979          | Thallium-208, water, unfiltered, picocuries per liter                                                                      |
| 29981          | Thallium-208, water, filtered, picocuries per liter                                                                        |
| 29983          | Xenon-135, water, unfiltered, picocuries per liter                                                                         |
| 29985          | Xenon-135, water, filtered, picocuries per liter                                                                           |
| 29987          | Yttrium-91 (metastable), water, unfiltered, picocuries per liter                                                           |
| 29989          | Yttrium-91 (metastable), water, filtered, picocuries per liter                                                             |
| 29991          | Zirconium-95, water, filtered, picocuries per liter                                                                        |
| 30207          | Gage height, above datum, meters                                                                                           |
| 30208          | Discharge, cubic meters per second                                                                                         |
| 30209          | Discharge, instantaneous, cubic meters per second                                                                          |
| 30210          | Depth to water level, below land surface datum (LSD), meters                                                               |
| 30211          | Elevation above NGVD 1929, meters                                                                                          |
| 30320          | Uranium, bed sediment, dry weight, micrograms per gram                                                                     |
| 39036          | Alkalinity, water, filtered, fixed endpoint (pH 4.5) titration, field, milligrams per liter as calcium carbonate           |
| 39086          | Alkalinity, water, filtered, incremental titration, field, milligrams per liter as calcium carbonate                       |
| 39087          | Alkalinity, water, filtered, incremental titration, laboratory, milligrams per liter as calcium carbonate                  |
| 46005          | Acid neutralizing capacity, water, unfiltered, bromthymol blue endpoint (pH 6.0-7.6) titration, milliequivalents per liter |
| 46253          | pH, 1 to 1 soil/water mixture, standard units                                                                              |
| 46516          | Solar radiation, net, calories per square centimeter per minute                                                            |
| 46569          | Iron (biologically reactive), water, unfiltered, tons per day                                                              |
| 49470          | Gross alpha radioactivity, water, unfiltered, Pu-239 curve, picocuries per liter                                           |
| 49472          | Bismuth-212, water, unfiltered, picocuries per liter                                                                       |
| 49475          | Plutonium-239 plus plutonium-240, water, unfiltered, picocuries per liter                                                  |
| 49476          | Europium-152, water, unfiltered, picocuries per liter                                                                      |
| 49478          | Plutonium-239 plus plutonium-240, water, filtered, picocuries per liter                                                    |
| 49480          | Nickel-63, water, unfiltered, picocuries per liter                                                                         |
| 49482          | Chlorine-36, water, unfiltered, picocuries per liter                                                                       |
| 49902          | Sulfur-34/Sulfur-32 ratio in sulfide, water, filtered, per mil                                                             |
| 49926          | Carbon-13/Carbon-12 ratio in carbon dioxide, per mil                                                                       |
| 49927          | Carbon-13/Carbon-12 ratio, rock, per mil                                                                                   |
| 49928          | Sulfur-34/Sulfur-32 ratio in sulfate, rock, per mil                                                                        |
| 49929          | Sulfur-34/Sulfur-32 ratio in sulfide, rock, per mil                                                                        |
| 49930          | Sulfur-34/Sulfur-32 ratio in disulfide, rock, per mil                                                                      |
| 49931          | Sulfur-34/Sulfur-32 ratio in monosulfide, rock, per mil                                                                    |
| 49932          | Sulfur-34/Sulfur-32 ratio in sulfate, water, filtered, per mil                                                             |
| 49938          | Gamma radioactivity scan, water, filtered, picocuries per liter                                                            |
| 49940          | Plutonium-239 plus plutonium-240, water, filtered, picocuries per liter                                                    |
| 49944          | Gross alpha radioactivity, bed sediment, natural uranium curve, dry weight, micrograms per gram                            |
| 49946          | Gross alpha radioactivity, suspended sediment, natural uranium curve, dry weight, micrograms per gram                      |

| Parameter code | Parameter name                                                                                     |
|----------------|----------------------------------------------------------------------------------------------------|
| 49960          | Gross alpha radioactivity, suspended sediment, Th-230 curve, dry weight, picocuries per gram       |
| 49962          | Gross beta radioactivity, bed sediment, Cs-137 curve, dry weight, picocuries per gram              |
| 49964          | Gross beta radioactivity, suspended sediment, Cs-137 curve, dry weight, picocuries per gram        |
| 49966          | Gross beta radioactivity, suspended sediment, Sr-89/90 curve, dry weight, picocuries per gram      |
| 49972          | Radium-226, bed sediment, dry weight, picocuries per gram                                          |
| 49974          | Plutonium-238, suspended sediment, dry weight, picocuries per gram                                 |
| 49976          | Plutonium-239 plus plutonium-240, suspended sediment, dry weight, picocuries per gram              |
| 49978          | Cesium-137, bed sediment, dry weight, picocuries per gram                                          |
| 49980          | Americium-241, suspended sediment, dry weight, picocuries per gram                                 |
| 50006          | Metolachlor, water, dissolved, recoverable, grams per day                                          |
| 50007          | Atrazine, water, dissolved, recoverable, grams per day                                             |
| 50047          | Flow, maximum during 24 hour period, million gallons per day                                       |
| 50048          | Flow, minimum during 24 hour period, million gallons per day                                       |
| 50050          | Flow, in conduit or through a treatment plant, million gallons per day                             |
| 50051          | Flow rate, instantaneous, million gallons per day                                                  |
| 50052          | Flow total during composite period, thousands of gallons                                           |
| 50420          | Plutonium-239 plus plutonium-240, bed sediment, dry weight, picocuries per gram                    |
| 50423          | Plutonium-238, bed sediment, dry weight, picocuries per gram                                       |
| 50833          | Radium-224, water, filtered, picocuries per liter                                                  |
| 50835          | Radium-224, water, unfiltered, picocuries per liter                                                |
| 50838          | Radium-226, water, unfiltered, gamma count, picocuries per liter                                   |
| 61036          | Delta helium-3, water, unfiltered, ingrowth method, percent                                        |
| 61053          | Uranium, bed sediment smaller than 2 millimeters, total digestion, dry weight, micrograms per gram |
| 61738          | Thorium-228, water, filtered, picocuries per liter                                                 |
| 62164          | Gross gamma radioactivity, water, unfiltered, picocuries per liter                                 |
| 62636          | Alpha radioactivity, 72-hour count, water, filtered, Th-230 curve, picocuries per liter            |
| 62639          | Alpha radioactivity, 30-day count, water, filtered, Th-230 curve, picocuries per liter             |
| 62642          | Beta radioactivity, 72-hour count, water, filtered, Cs-137 curve, picocuries per liter             |
| 62645          | Beta radioactivity, 30-day count, water, filtered, Cs-137 curve, picocuries per liter              |
| 62648          | Boron-11/Boron-10 ratio, water, filtered, per mil                                                  |
| 63001          | Oxidation reduction potential, raw emf, reference electrode not specified, millivolts              |
| 63002          | Oxidation reduction potential, relative to the standard hydrogen electrode (SHE), millivolts       |
| 63014          | Gross alpha radioactivity, 72 hour count, water, unfiltered, Th-230 curve, picocuries per liter    |
| 63015          | Gross beta radioactivity, 72 hour count, water, unfiltered, Cs-137 curve, picocuries per liter     |
| 63016          | Gross alpha radioactivity, 30 day recount, water, unfiltered, Th-230 curve, picocuries per liter   |
| 63017          | Gross beta radioactivity, 30 day recount, water, unfiltered, Cs-137 curve, picocuries per liter    |
| 63018          | Gross alpha radioactivity, water, unfiltered, Th-230 curve, picocuries per liter                   |

| Parameter code | Parameter name                                                                         |
|----------------|----------------------------------------------------------------------------------------|
| 63019          | Plutonium-241, water, filtered, picocuries per liter                                   |
| 63020          | Plutonium-241, water, unfiltered, picocuries per liter                                 |
| 63021          | Plutonium-241, suspended sediment, dry weight, picocuries per gram                     |
| 63022          | Plutonium-241, bed sediment, dry weight, picocuries per gram                           |
| 63023          | Radium-224, suspended sediment, dry weight, picocuries per gram                        |
| 63024          | Thorium-228, suspended sediment, picocuries per liter                                  |
| 63025          | Alpha-emitting isotopes of radium, water, unfiltered, picocuries per liter             |
| 63026          | Alpha-emitting isotopes of radium, suspended sediment, dry weight, picocuries per gram |
| 63027          | Alpha-emitting isotopes of radium, bed sediment, dry weight, picocuries per gram       |
| 63028          | Total radioactive strontium, water, filtered, picocuries per liter                     |
| 63029          | Total radioactive strontium, water, unfiltered, picocuries per liter                   |
| 63030          | Total radioactive strontium, suspended sediment, dry weight, picocuries per gram       |
| 63031          | Total radioactive strontium, bed sediment, dry weight, picocuries per gram             |
| 63032          | Uranium, water, unfiltered, micrograms per liter                                       |
| 63033          | Uranium, suspended sediment, dry weight, micrograms per gram                           |
| 63034          | Uranium, bed sediment, dry weight, picocuries per gram                                 |
| 63035          | Nitrogen-15/Nitrogen-14 ratio in total nitrogen fraction, solids, per mil              |
| 63036          | Nitrogen-15/Nitrogen-14 ratio in nitrate fraction, solids, per mil                     |
| 63037          | Nitrogen-15/Nitrogen-14 ratio in exchangeable ammonium fraction, solids, per mil       |
| 63038          | Carbon-13/Carbon-12 ratio in total carbon fraction, solids, per mil                    |
| 63040          | Oxygen-18/Oxygen-16 ratio in nitrate fraction, solids, per mil                         |
| 63041          | Oxygen-18/Oxygen-16 ratio in nitrate fraction, water, filtered, per mil                |
| 63150          | Nitrogen-15/Nitrogen-14 ratio, dissolved gas, per mil                                  |
| 63511          | Carbon-13/Carbon-12 ratio in organic carbon, biota, tissue, per mil                    |
| 63512          | Nitrogen-15/Nitrogen-14 ratio in organic nitrogen, biota, tissue, per mil              |
| 63513          | Carbon-13/Carbon-12 ratio in organic carbon, suspended sediment, per mil               |
| 63514          | Nitrogen-15/Nitrogen-14 ratio in organic nitrogen, suspended sediment, per mil         |
| 63515          | Carbon-13/Carbon-12 ratio in organic carbon, bed sediment, per mil                     |
| 63516          | Nitrogen-15/Nitrogen-14 ratio in organic nitrogen, bed sediment, per mil               |
| 70290          | Chloride, water, dissolved, tons per day                                               |
| 70291          | Sulfate, water, dissolved, tons per day                                                |
| 70302          | Residue, water, dissolved, tons per day                                                |
| 70310          | pH, bed sediment, standard units                                                       |
| 70508          | Acidity, water, unfiltered, heated, milligrams per liter as calcium carbonate          |
| 70959          | Productivity, primary, gross, milligrams oxygen per cubic meter per day                |
| 70963          | Productivity, primary, net, milligrams oxygen per cubic meter per day                  |
| 70967          | Respiration, milligrams oxygen per cubic meter per day                                 |
| 71825          | Acidity, water, unfiltered, heated, milligrams per liter as hydrogen ion               |
| 72000          | Altitude of land surface, feet                                                         |
| 72012          | Temperature, specific gravity measurement, degrees Celsius                             |
| 72014          | Temperature, resistivity measurement, degrees Celsius                                  |
| 72019          | Depth to water level, feet below land surface                                          |
| 72020          | Elevation above NGVD 1929, feet                                                        |
| 72040          | Drawdown observed, feet                                                                |
| 72103          | Sample location, relative to right bank, looking downstream, feet                      |
| 72104          | Sample location, distance downstream, feet                                             |
| 72105          | Sample location, distance upstream, feet                                               |

| Parameter code | Parameter name                                                                             |
|----------------|--------------------------------------------------------------------------------------------|
| 72106          | Elevation of sample, feet                                                                  |
| 72136          | Hydrostatic head difference, ground water minus surface water, millimeters                 |
| 74082          | Streamflow, daily, acre-feet                                                               |
| 75032          | Zirconium, niobium-95, water, unfiltered, picocuries per liter                             |
| 75038          | Potassium-40, water, unfiltered, picocuries per liter                                      |
| 75935          | PCBs, suspended sediment, recoverable, grams per day                                       |
| 75937          | Radium-228, suspended sediment, dry weight, picocuries per gram                            |
| 75938          | Polonium-210, suspended sediment, dry weight, picocuries per gram                          |
| 75939          | Thorium-230, suspended sediment, dry weight, picocuries per gram                           |
| 75940          | Uranium-238, suspended sediment, dry weight, picocuries per gram                           |
| 75942          | Uranium-234, suspended sediment, dry weight, picocuries per gram                           |
| 75944          | Radium-226, suspended sediment, dry weight, picocuries per gram                            |
| 75946          | Lead-210, suspended sediment, dry weight, picocuries per gram                              |
| 75953          | Thorium-232, suspended sediment, dry weight, picocuries per gram                           |
| 75975          | Uranium-235, suspended sediment, dry weight, picocuries per gram                           |
| 75976          | Thorium-232, water, filtered, picocuries per liter                                         |
| 75977          | Radium-228, bed sediment, dry weight, picocuries per gram                                  |
| 75978          | Strontium-87/Strontium-86 ratio, water, filtered, per mil                                  |
| 78890          | Sampling depth, feet below mean sea level                                                  |
| 78891          | Sampling depth, meters below mean sea level                                                |
| 80015          | Uranium, water, filtered, extraction fluorometric method, picocuries per liter             |
| 80029          | Gross alpha radioactivity, water, unfiltered, natural uranium curve, micrograms per liter  |
| 80030          | Gross alpha radioactivity, water, filtered, natural uranium curve, micrograms per liter    |
| 80040          | Gross alpha radioactivity, suspended sediment, natural uranium curve, micrograms per liter |
| 80049          | Gross beta radioactivity, water, unfiltered, Sr-90/Y-90 curve, picocuries per liter        |
| 80050          | Gross beta radioactivity, water, filtered, Sr-90/Y-90 curve, picocuries per liter          |
| 80060          | Gross beta radioactivity, suspended sediment, Sr-90/Y-90 curve, picocuries per liter       |
| 80155          | Suspended sediment discharge, tons per day                                                 |
| 80156          | Total sediment discharge, tons per day                                                     |
| 80221          | Suspended sediment load larger than 0.0625 millimeters, sieve diameter, tons per day       |
| 80223          | Suspended sediment load smaller than 0.0625 millimeters, sieve diameter, tons per day      |
| 80225          | Bedload sediment discharge, tons per day                                                   |
| 81027          | Temperature, soil, degrees Celsius                                                         |
| 81029          | Temperature, snow, degrees Celsius                                                         |
| 81200          | Silica, water, dissolved, tons per day                                                     |
| 81201          | Calcium, water, dissolved, tons per day                                                    |
| 81202          | Magnesium, water, dissolved, tons per day                                                  |
| 81203          | Sodium, water, dissolved, tons per day                                                     |
| 81204          | Potassium, water, dissolved, tons per day                                                  |
| 81205          | Bicarbonate, water, dissolved, tons per day                                                |
| 81366          | Radium-228, water, filtered, picocuries per liter                                          |
| 81380          | Discharge velocity, meters per second                                                      |
| 81903          | Depth to bottom at sample location, feet                                                   |
| 81904          | Velocity at point in stream, feet per second                                               |

| Parameter code | Parameter name                                                                                                            |
|----------------|---------------------------------------------------------------------------------------------------------------------------|
| 81907          | Well recovery, feet                                                                                                       |
| 81908          | Recovery fraction ratio                                                                                                   |
| 81917          | Temperature at bottom of hole, degrees Fahrenheit                                                                         |
| 82068          | Potassium-40, water, filtered, picocuries per liter                                                                       |
| 82070          | Potassium-40, suspended sediment, picocuries per liter                                                                    |
| 82072          | Dial reading, number                                                                                                      |
| 82081          | Carbon-13/Carbon-12 ratio, water, unfiltered, per mil                                                                     |
| 82082          | Deuterium/Protium ratio, water, unfiltered, per mil                                                                       |
| 82083          | Lithium-7/Lithium-6 ratio, water, unfiltered, per mil                                                                     |
| 82084          | Nitrogen-15/Nitrogen-14 ratio, water, unfiltered, per mil                                                                 |
| 82085          | Oxygen-18/Oxygen-16 ratio, water, unfiltered, per mil                                                                     |
| 82086          | Sulfur-34/Sulfur-32 ratio, water, unfiltered, per mil                                                                     |
| 82087          | Uranium-238/Uranium-234 ratio, water, unfiltered, per mil                                                                 |
| 82303          | Radon-222, water, unfiltered, picocuries per liter                                                                        |
| 82305          | Radon-222, water, dissolved, picocuries per liter                                                                         |
| 82307          | Cobalt-60, water, filtered, picocuries per liter                                                                          |
| 82336          | Sulfur-34/Sulfur-32 ratio, bed sediment, per mil                                                                          |
| 82337          | Oxygen-18/Oxygen-16 ratio, bed sediment, per mil                                                                          |
| 82338          | Nitrogen-15/Nitrogen-14 ratio, bed sediment, per mil                                                                      |
| 82339          | Carbon-13/Carbon-12 ratio, bed sediment, per mil                                                                          |
| 82341          | Nitrogen-15/Nitrogen-14 ratio in organic fraction, soil or rock, per mil                                                  |
| 82362          | Radon-222, water, dissolved, picocuries per liter                                                                         |
| 82583          | pH, soil, standard units                                                                                                  |
| 82688          | Nitrogen-15/Nitrogen-14 ratio in nitrate fraction, soil, per mil                                                          |
| 82689          | Nitrogen-15/Nitrogen-14 ratio in ammonia fraction, soil, per mil                                                          |
| 82690          | Nitrogen-15/Nitrogen-14 ratio in nitrate fraction, water, filtered, per mil                                               |
| 82691          | Nitrogen-15/Nitrogen-14 ratio in ammonia fraction, water, filtered, per mil                                               |
| 82698          | Nitrogen-15/nitrogen-14 ratio in nitrogen gas fraction, water, unfiltered, per mil                                        |
| 82699          | Oxygen-18/Oxygen-16 ratio in dissolved oxygen, water, unfiltered, per mil                                                 |
| 82700          | Carbon-13/Carbon-12 ratio in carbonate fraction, solids, per mil                                                          |
| 82701          | Chromium-53/Chromium-52 isotope ratio, water, filtered, per mil                                                           |
| 82702          | Boron-11/Boron-10 ratio, water, unfiltered, per mil                                                                       |
| 82725          | Chlorine-37/Chlorine-35 ratio, water, filtered, per mil                                                                   |
| 82726          | Bromine-81/Bromine-79 ratio, water, filtered, per mil                                                                     |
| 82727          | Oxygen-18/Oxygen-16 ratio in sulfate, water, filtered, per mil                                                            |
| 82904          | Acid neutralizing capacity, wet atmospheric deposition, unfiltered, field, milligrams per liter as calcium carbonate      |
| 82905          | Acid neutralizing capacity, wet atmospheric deposition, unfiltered, field, microequivalents per liter                     |
| 82906          | Acid neutralizing capacity, wet atmospheric deposition, unfiltered, laboratory, milligrams per liter as calcium carbonate |
| 82907          | Acid neutralizing capacity, wet atmospheric deposition, unfiltered, laboratory, microequivalents per liter                |
| 83104          | pH, wet atmospheric deposition, unfiltered, calculated, standard units                                                    |
| 83106          | pH, wet atmospheric deposition, unfiltered, field, standard units                                                         |
| 83107          | pH, wet atmospheric deposition, unfiltered, lab, standard units                                                           |
| 83186          | Acid neutralizing capacity, bulk atmospheric deposition, unfiltered, field, milligrams per liter as calcium carbonate     |

| Parameter code | Parameter name                                                                                                                          |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 83187          | Acid neutralizing capacity, bulk atmospheric deposition, unfiltered, field, microequivalents per liter                                  |
| 83188          | Acid neutralizing capacity, bulk atmospheric deposition, unfiltered, laboratory, milligrams per liter as calcium carbonate              |
| 83189          | Acid neutralizing capacity, bulk atmospheric deposition, unfiltered, laboratory, microequivalents per liter                             |
| 83386          | pH, bulk atmospheric deposition, unfiltered, calculated, standard units                                                                 |
| 83388          | pH, bulk atmospheric deposition, unfiltered, field, standard units                                                                      |
| 83389          | pH, bulk atmospheric deposition, unfiltered, laboratory, standard units                                                                 |
| 85557          | Temperature, low saturation, degrees Celsius                                                                                            |
| 85558          | Temperature, high saturation, degrees Celsius                                                                                           |
| 85817          | Gross beta radioactivity, water, unfiltered, picocuries per liter                                                                       |
| 90010          | Temperature, area-weighted-average, degrees Celsius                                                                                     |
| 90400          | pH, water, area weighted average, standard units                                                                                        |
| 90410          | Acid neutralizing capacity, water, unfiltered, fixed endpoint (pH 4.5) titration, laboratory, milligrams per liter as calcium carbonate |
| 91006          | Nitrate, water, dissolved, tons per day                                                                                                 |
| 91007          | Phosphorus, water, unfiltered, tons per day                                                                                             |
| 91008          | Phosphorus, water, dissolved, tons per day                                                                                              |
| 91009          | Iron, water, unfiltered, tons per day                                                                                                   |
| 91010          | Iron, water, dissolved, tons per day                                                                                                    |
| 91012          | Nitrite, water, dissolved, tons of nitrogen per day                                                                                     |
| 91014          | Ammonia, water, dissolved, tons of nitrogen per day                                                                                     |
| 91015          | Ammonia, water, unfiltered, tons of nitrogen per day                                                                                    |
| 91016          | Biochemical oxygen demand, water, unfiltered, 5 days at 20 degrees Celsius, tons per day                                                |
| 91017          | Suspended solids, dried at 110 degrees Celsius, water, unfiltered, tons per day                                                         |
| 91047          | Organic nitrogen, water, unfiltered, pounds of nitrogen per day                                                                         |
| 91048          | Ammonia, water, unfiltered, pounds of nitrogen per day                                                                                  |
| 91050          | Phosphorus, water, unfiltered, pounds per day                                                                                           |
| 91055          | Suspended solids, dried at 105 degrees Celsius, water, unfiltered, tons per day                                                         |
| 91056          | Loss on ignition, from suspended solids, water, unfiltered, tons per day                                                                |
| 91058          | Total nitrogen, water, unfiltered, pounds per day                                                                                       |
| 91059          | Orthophosphate, water, unfiltered, pounds per day                                                                                       |
| 91060          | Orthophosphate, water, dissolved, pounds per day                                                                                        |
| 95100          | Conversion factor, number                                                                                                               |
| 95410          | Acid neutralizing capacity, water, unfiltered, fixed endpoint (pH 4.5) titration, laboratory, milligrams per liter as calcium carbonate |
| 99019          | Water level, depth below land surface, meters                                                                                           |
| 99020          | Elevation above NGVD 1929, meters                                                                                                       |
| 99060          | Discharge, cubic meters per second                                                                                                      |
| 99061          | Discharge, instantaneous, cubic meters per second                                                                                       |
| 99065          | Gage height, above datum, meters                                                                                                        |
| 99066          | Hyporheic flux of water from ground water to surface water, milliliters per square centimeter per day                                   |
| 99225          | Datum offset, elevation of station's Aquatrak leveling point in reference to established datum, meters                                  |
| 99226          | Sensor offset, Aquatrak sensor, meters                                                                                                  |
| 99227          | Primary water level, Aquatrak, distance from measuring point to water surface,                                                          |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                      |

| 99909                 | USGS Water Science Center special 99909                                                                                    |
| 99975                 | pH, 1 meter below water surface, standard units                                                                            |
| 99979                 | pH, water, 1 meter above bottom, standard units                                                                            |
| 99983                 | pH, water, mid-depth, standard units                                                                                       |

## 4.9 Appendix I. Parameters that are Not Output as Zero and Can Be Entered into QWDATA

| Parameter code | Parameter name                                                                                                                        |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 00191          | Hydrogen ion, water, unfiltered, calculated, milligrams per liter                                                                     |
| 00294          | Chemical oxygen demand, soluble, dry atmospheric deposition, milligrams per kilogram                                                  |
| 00296          | Chemical oxygen demand, insoluble, dry atmospheric deposition, milligrams per kilogram                                                |
| 00297          | Chemical oxygen demand, total, dry atmospheric deposition, milligrams per kilogram                                                    |
| 00300          | Dissolved oxygen, water, unfiltered, milligrams per liter                                                                             |
| 00302          | Immediate oxygen demand, water, unfiltered, 20 degrees Celsius, milligrams per liter                                                  |
| 00310          | Biochemical oxygen demand, water, unfiltered, 5 days at 20 degrees Celsius, milligrams per liter                                      |
| 00315          | Biochemical oxygen demand, water, unfiltered, 7 days at 20 degrees Celsius, milligrams per liter                                      |
| 00319          | Ultimate biochemical oxygen demand, water, unfiltered, 20 degrees Celsius, milligrams per liter                                       |
| 00320          | Ultimate carbonaceous biochemical oxygen demand, water, unfiltered, 20 degrees Celsius, milligrams per liter                          |
| 00321          | Ultimate nitrogenous biochemical oxygen demand, water, unfiltered, milligrams per liter                                               |
| 00324          | Biochemical oxygen demand, water, unfiltered, 20 days at 20 degrees Celsius, milligrams per liter                                     |
| 00335          | Chemical oxygen demand, low level, water, unfiltered, milligrams per liter                                                            |
| 00339          | Chemical oxygen demand, bed sediment, total, dry weight, milligrams per kilogram                                                      |
| 00340          | Chemical oxygen demand, high level, water, unfiltered, milligrams per liter                                                           |
| 00349          | Biochemical oxygen demand, water, unfiltered, 30 days at 20 degrees Celsius, milligrams per liter                                     |
| 00359          | Biochemical oxygen demand, water, filtered, 5 days at 20 degrees Celsius, milligrams per liter                                        |
| 00405          | Carbon dioxide, water, unfiltered, milligrams per liter                                                                               |
| 00408          | pH, water, filtered, laboratory, standard units                                                                                       |
| 00420          | Hydroxide, water, unfiltered, milligrams per liter                                                                                    |
| 00435          | Acidity, water, unfiltered, milligrams per liter as calcium carbonate                                                                 |
| 00436          | Mineral acidity, water, unfiltered, methyl orange endpoint (pH 3.1-4.4) titration, milligrams per liter as calcium carbonate          |
| 00437          | Carbon dioxide acidity, water, unfiltered, phenolphthalein endpoint (pH 8.5-9.0) titration, milligrams per liter as calcium carbonate |
| 00440          | Bicarbonate, water, unfiltered, fixed endpoint (pH 4.5) titration, field, milligrams per liter                                        |
| 00449          | Bicarbonate, water, unfiltered, inflection-point titration method (incremental titration method), laboratory, milligrams per liter    |
| 00450          | Bicarbonate, water, unfiltered, inflection-point titration method (incremental titration method), field, milligrams per liter         |
| 00451          | Bicarbonate, water, unfiltered, fixed endpoint (pH 4.5) titration, laboratory, milligrams per liter                                   |
| 00453          | Bicarbonate, water, filtered, inflection-point titration method (incremental titration method), field, milligrams per liter           |
| 00496          | Loss on ignition, bed sediment, dry weight, milligrams per kilogram                                                                   |
| 00500          | Total solids dried at 105 degrees Celsius, water, unfiltered, milligrams per liter                                                    |
| 00505          | Loss on ignition of total solids, water, unfiltered, milligrams per liter                                                             |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| 00510                 | Total solids remaining after ignition, water, unfiltered, milligrams per liter                                                     |
| 00515                 | Dissolved solids dried at 105 degrees Celsius, water, filtered, milligrams per liter                                               |
| 00520                 | Loss on ignition of dissolved solids, water, filtered, milligrams per liter                                                        |
| 00525                 | Dissolved solids remaining after ignition, water, filtered, milligrams per liter                                                   |
| 00530                 | Suspended solids, water, unfiltered, milligrams per liter                                                                          |
| 00535                 | Loss on ignition of suspended solids, water, unfiltered, milligrams per liter                                                      |
| 00540                 | Suspended solids remaining after ignition, water, unfiltered, milligrams per liter                                                 |
| 00545                 | Settleable solids, water, unfiltered, milligrams per liter                                                                         |
| 00548                 | Non-settleable solids remaining after ignition, milligrams per liter                                                               |
| 00549                 | Loss on ignition of non-settleable solids, milligrams per liter                                                                    |
| 00550                 | Oil and grease, water, unfiltered, recoverable, milligrams per liter                                                               |
| 00551                 | Petroleum hydrocarbons, water, unfiltered, CCl <sub>4</sub> extraction, infrared chromatography, recoverable, milligrams per liter |
| 00552                 | Oil and grease, water, unfiltered, hexane extraction, recoverable, milligrams per liter                                            |
| 00553                 | Oil and grease, bed sediment, hexane extraction, recoverable, dry weight, milligrams per kilogram                                  |
| 00556                 | Oil and grease, water, unfiltered, freon extraction, gravimetric, recoverable, milligrams per liter                                |
| 00557                 | Oil and grease, bed sediment, freon extraction, gravimetric, recoverable, dry weight, milligrams per kilogram                      |
| 00560                 | Oil and grease, water, unfiltered, freon extraction, electrometric infrared, recoverable, milligrams per liter                     |
| 00561                 | Oil and grease, bed sediment, freon extraction, electrometric infrared, recoverable, dry weight, milligrams per kilogram           |
| 00572                 | Biomass, periphyton, ash weight, grams per square meter                                                                            |
| 00573                 | Biomass, periphyton, dry weight, grams per square meter                                                                            |
| 00597                 | Dissolved nitrogen gas, water, unfiltered, milligrams per liter                                                                    |
| 00600                 | Total nitrogen, water, unfiltered, milligrams per liter                                                                            |
| 00601                 | Total nitrogen, suspended sediment, total, milligrams per liter                                                                    |
| 00602                 | Total nitrogen, water, filtered, milligrams per liter                                                                              |
| 00603                 | Total nitrogen, bed sediment, total, dry weight, milligrams per kilogram                                                           |
| 00605                 | Organic nitrogen, water, unfiltered, milligrams per liter                                                                          |
| 00606                 | Organic nitrogen, suspended sediment, total, milligrams per liter                                                                  |
| 00607                 | Organic nitrogen, water, filtered, milligrams per liter                                                                            |

| 34859                 | Europium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34860                 | Gallium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram        |
| 34861                 | Gallium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram         |
| 34862                 | Gallium, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram   |
| 34863                 | Gallium, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34864                 | Gallium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                      |
| 34865                 | Germanium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram      |
| 34866                 | Germanium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram       |
| 34867                 | Germanium, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram |
| 34868                 | Germanium, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                   |
| 34869                 | Germanium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                    |
| 34870                 | Gold, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram           |
| 34871                 | Gold, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram            |
| 34872                 | Gold, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram      |
| 34873                 | Gold, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                        |
| 34874                 | Gold, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                         |
| 34875                 | Holmium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram        |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 34876                 | Holmium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram         |
| 34877                 | Holmium, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram   |
| 34878                 | Holmium, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34879                 | Holmium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                      |
| 34885                 | Lanthanum, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram      |
| 34886                 | Lanthanum, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram       |
| 34887                 | Lanthanum, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram |
| 34888                 | Lanthanum, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                   |
| 34889                 | Lanthanum, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                    |
| 34890                 | Lead, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram           |
| 34891                 | Lead, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram            |
| 34892                 | Lead, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram      |
| 34893                 | Lead, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                        |
| 34894                 | Lead, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                         |
| 34895                 | Lithium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram        |
| 34896                 | Lithium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram         |
| 34897                 | Lithium, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram   |
| 34898                 | Lithium, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34899                 | Lithium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                      |
| 34905                 | Manganese, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram      |
| 34906                 | Manganese, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram       |
| 34907                 | Manganese, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram |
| 34908                 | Manganese, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                   |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------|
| 34909                 | Manganese, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34910                 | Mercury, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram         |
| 34911                 | Mercury, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram          |
| 34912                 | Mercury, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram    |
| 34913                 | Mercury, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                      |
| 34914                 | Mercury, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                       |
| 34915                 | Molybdenum, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram      |
| 34916                 | Molybdenum, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram       |
| 34917                 | Molybdenum, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram |
| 34918                 | Molybdenum, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                   |
| 34919                 | Molybdenum, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                    |
| 34920                 | Neodymium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram       |
| 34921                 | Neodymium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram        |
| 34922                 | Neodymium, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram  |
| 34923                 | Neodymium, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                    |
| 34924                 | Neodymium, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                     |
| 34925                 | Nickel, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram          |
| 34926                 | Nickel, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram           |
| 34927                 | Nickel, bed sediment smaller than 62.5 microns, dry sieved, laboratory, total digestion, dry weight, micrograms per gram     |
| 34928                 | Nickel, suspended sediment smaller than 62.5 microns, total digestion, dry weight, micrograms per gram                       |
| 34929                 | Nickel, suspended sediment larger than 62.5 microns, total digestion, dry weight, micrograms per gram                        |
| 34930                 | Niobium, bed sediment smaller than 62.5 microns, wet sieved, field, total digestion, dry weight, micrograms per gram         |
| 34931                 | Niobium, bed sediment smaller than 177 microns, wet sieved, field, total digestion, dry weight, micrograms per gram          |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                       |

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 49423                 | 3-Nitrophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 49424                 | C8-Alkylphenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram              |
| 49425                 | Pentachlorophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram           |
| 49426                 | Bis(2-ethylhexyl) phthalate, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 49427                 | Benzyl n-butyl phthalate, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram    |
| 49428                 | Acenaphthylene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram              |
| 49429                 | Acenaphthene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 49430                 | Acridine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                    |
| 49431                 | N-Nitrosodi-n-propylamine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram   |
| 49432                 | N-Nitrosodimethylamine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram      |
| 49433                 | N-Nitrosodiphenylamine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram      |
| 49434                 | Anthracene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                  |
| 49435                 | 2-Methylandracene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram           |
| 49436                 | Benzo[a]anthracene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram          |
| 49437                 | 9,10-Anthraquinone, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram          |
| 49438                 | 1,2,4-Trichlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram      |
| 49439                 | 1,2-Dichlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram         |
| 49440                 | 1,3,5-Trichlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram      |
| 49441                 | 1,3-Dichlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram         |
| 49442                 | 1,4-Dichlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram         |
| 49443                 | Azobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                  |
| 49444                 | Nitrobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 49445                 | Pentachlorobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram          |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 49446                 | Pentachloronitrobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram      |
| 49447                 | PCB congener 1, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 49448                 | Hexachlorobutadiene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram          |
| 49449                 | Carbazole, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                    |
| 49450                 | Chrysene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                     |
| 49451                 | p-Cresol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                     |
| 49452                 | Dibenzothiophene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram             |
| 49453                 | Hexachloroethane, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram             |
| 49454                 | 4-Bromophenyl phenyl ether, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram   |
| 49455                 | 4-Chlorophenyl phenyl ether, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram  |
| 49456                 | Bis(2-chloroethyl) ether, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram     |
| 49457                 | Bis(2-chloroisopropyl) ether, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 49458                 | Benzo[b]fluoranthene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram         |
| 49459                 | PCBs, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                         |
| 49460                 | Pentachloroanisole, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram           |
| 49461                 | Dibenzo[a,h]anthracene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram       |
| 49465                 | Vanadium, biota, tissue, recoverable, dry weight, micrograms per gram                                                                                     |
| 49466                 | Fluoranthene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                 |
| 49467                 | 2-Chlorophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 49468                 | Benzo[c]cinnoline, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram            |
| 49469                 | Gross beta radioactivity counting error, water, unfiltered, Cs-137 curve, picocuries per liter                                                            |
| 49471                 | Gross alpha radioactivity counting error, water, unfiltered, Pu-239 curve, picocuries per liter                                                           |
| 49473                 | Bismuth-212 counting error, water, unfiltered, picocuries per liter                                                                                       |
| 49474                 | Plutonium-239 plus plutonium-240 counting error, water, unfiltered, picocuries per liter                                                                  |
| 49477                 | Europium-152 counting error, water, unfiltered, picocuries per liter                                                                                      |
| 49479                 | Plutonium-239 plus plutonium-240 counting error, water, filtered, picocuries per liter                                                                    |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 49481                 | Nickel-63 counting error, water, unfiltered, picocuries per liter                                                                                       |
| 49483                 | Chlorine-36 counting error, water, unfiltered, picocuries per liter                                                                                     |
| 49484                 | Plutonium-239 plus plutonium-240 counting error, suspended sediment, picocuries per liter                                                               |
| 49486                 | Plutonium-238 counting error, suspended sediment, picocuries per liter                                                                                  |
| 49488                 | 2-Methyl-4,6-dinitrophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 49489                 | Hexachlorocyclopentadiene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram  |
| 49538                 | 1,1-Difluoroethane, water, unfiltered, recoverable, micrograms per liter                                                                                |
| 49541                 | Chloropentafluoroethane, water, unfiltered, recoverable, micrograms per liter                                                                           |
| 49570                 | Particulate nitrogen, suspended in water, milligrams per liter                                                                                          |
| 49688                 | cis-Nonachlor, suspended sediment, recoverable, micrograms per liter                                                                                    |
| 49816                 | PCB congener 3, water, filtered, recoverable, nanograms per liter                                                                                       |
| 49817                 | PCB congeners 4+10, water, filtered, recoverable, nanograms per liter                                                                                   |
| 49820                 | PCB congener 25, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49821                 | PCB congener 53, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49822                 | PCB congener 51, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49823                 | PCB congener 63, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49824                 | PCB congener 66, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49825                 | PCB congener 95, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49826                 | PCB congener 89, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49827                 | PCB congener 83, water, filtered, recoverable, nanograms per liter                                                                                      |
| 49830                 | PCB congener 158, water, filtered, recoverable, nanograms per liter                                                                                     |
| 49832                 | PCB congener 193, water, filtered, recoverable, nanograms per liter                                                                                     |
| 49833                 | PCB congener 198, water, filtered, recoverable, nanograms per liter                                                                                     |
| 49834                 | PCB congener 207, water, filtered, recoverable, nanograms per liter                                                                                     |
| 49835                 | PCB congener 3, suspended sediment, recoverable, nanograms per liter                                                                                    |
| 49836                 | PCB congeners 4+10, suspended sediment, recoverable, nanograms per liter                                                                                |

| 62338                 | Hexachlorodibenzofurans (all isomers), soil, recoverable, dry weight, picograms per gram                      |
| 62339                 | Heptachlorodibenzofurans (all isomers), soil, recoverable, dry weight, picograms per gram                     |
| 62359                 | Pheophytin <i>a</i> , periphyton, milligrams per square meter                                                 |
| 62360                 | Pheophytin <i>a</i> , phytoplankton, micrograms per liter                                                     |
| 62361                 | Chlorophyll, total, water, fluorometric, 650-700 nanometers, in situ sensor, micrograms per liter             |
| 62370                 | PCB congener 3, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                   |
| 62371                 | PCB congeners 4 plus 10, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram          |
| 62372                 | PCB congener 6, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                   |
| 62373                 | PCB congeners 7 plus 9, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62374                 | PCB congeners 8 plus 5, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62375                 | PCB congeners 15 plus 17, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram         |
| 62376                 | PCB congener 18, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62377                 | PCB congener 19, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62378                 | PCB congeners 24 plus 27, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram         |
| 62379                 | PCB congeners 16 plus 32, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram         |
| 62380                 | PCB congener 22, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62381                 | PCB congener 25, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62382                 | PCB congener 26, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62383                 | PCB congeners 28 plus 31, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram         |
| 62384                 | PCB congener 33, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62385                 | PCB congener 40, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62386                 | PCB congeners 41 plus 64 plus 71, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram |
| 62387                 | PCB congeners 37 plus 42, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram         |
| 62388                 | PCB congener 44, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |
| 62389                 | PCB congener 45, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram                  |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| 62390                 | PCB congener 46, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62391                 | PCB congeners 47 plus 48, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram  |
| 62392                 | PCB congener 49, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62393                 | PCB congener 51, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62394                 | PCB congener 52, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62395                 | PCB congener 53, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62396                 | PCB congeners 56 plus 60, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram  |
| 62397                 | PCB congener 63, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62398                 | PCB congener 66, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62399                 | PCB congeners 70 plus 76, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram  |
| 62400                 | PCB congener 74, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62401                 | PCB congener 77, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62402                 | PCB congeners 77 plus 110, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram |
| 62403                 | PCB congener 82, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62404                 | PCB congener 83, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62405                 | PCB congener 85, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62406                 | PCB congener 87, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62407                 | PCB congener 89, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62408                 | PCB congener 91, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62409                 | PCB congeners 92 plus 84, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram  |
| 62410                 | PCB congener 95, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62411                 | PCB congener 97, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |
| 62412                 | PCB congener 99, bed sediment smaller than 2 mm, recoverable, dry weight, nanograms per gram           |

|-----------------------|-------------------------------------------------------------------------------------------------------------|
| 63208                 | Fluoranthene, solids, recoverable, dry weight, micrograms per kilogram                                      |
| 63209                 | Hexahydrohexamethyl cyclopentabenzopyran, solids, recoverable, dry weight, micrograms per kilogram          |
| 63210                 | Indole, solids, recoverable, dry weight, micrograms per kilogram                                            |
| 63211                 | Isoborneol, solids, recoverable, dry weight, micrograms per kilogram                                        |
| 63212                 | Isophorone, solids, recoverable, dry weight, micrograms per kilogram                                        |
| 63213                 | Isopropylbenzene, solids, recoverable, dry weight, micrograms per kilogram                                  |
| 63214                 | Isoquinoline, solids, recoverable, dry weight, micrograms per kilogram                                      |
| 63215                 | Menthol, solids, recoverable, dry weight, micrograms per kilogram                                           |
| 63216                 | Metalaxyl, solids, recoverable, dry weight, micrograms per kilogram                                         |
| 63217                 | Methyl salicylate, solids, recoverable, dry weight, micrograms per kilogram                                 |
| 63218                 | Metolachlor, solids, recoverable, dry weight, micrograms per kilogram                                       |
| 63219                 | DEET, solids, recoverable, dry weight, micrograms per kilogram                                              |
| 63220                 | Naphthalene, solids, recoverable, dry weight, micrograms per kilogram                                       |
| 63221                 | 4-Nonylphenol monoethoxylate (sum of all isomers), solids, recoverable, dry weight, micrograms per kilogram |
| 63222                 | p-Cresol, solids, recoverable, dry weight, micrograms per kilogram                                          |
| 63223                 | Pentachlorophenol, solids, recoverable, dry weight, micrograms per kilogram                                 |
| 63224                 | Phenanthrene, solids, recoverable, dry weight, micrograms per kilogram                                      |
| 63225                 | Phenol, solids, recoverable, dry weight, micrograms per kilogram                                            |
| 63226                 | Prometon, solids, recoverable, dry weight, micrograms per kilogram                                          |
| 63227                 | Pyrene, solids, recoverable, dry weight, micrograms per kilogram                                            |
| 63228                 | Tetrachloroethene, solids, recoverable, dry weight, micrograms per kilogram                                 |
| 63229                 | Tris(2-butoxyethyl) phosphate, solids, recoverable, dry weight, micrograms per kilogram                     |
| 63230                 | Tris(2-chloroethyl) phosphate, solids, recoverable, dry weight, micrograms per kilogram                     |
| 63231                 | Tributyl phosphate, solids, recoverable, dry weight, micrograms per kilogram                                |
| 63232                 | Triclosan, solids, recoverable, dry weight, micrograms per kilogram                                         |
| 63233                 | Triethyl citrate, solids, recoverable, dry weight, micrograms per kilogram                                  |
| 63234                 | Triphenyl phosphate, solids, recoverable, dry weight, micrograms per kilogram                               |
| 63235                 | Tris(dichloroisopropyl) phosphate, solids, recoverable, dry weight, micrograms per kilogram                 |
| 63236                 | Estrone, suspended sediment, recoverable, micrograms per liter                                              |
| 63237                 | 4-tert-Octylphenol diethoxylate, suspended sediment, recoverable, micrograms per liter                      |
| 63238                 | 4-tert-Octylphenol monoethoxylate, suspended sediment, recoverable, micrograms per liter                    |
| 63239                 | 1,4-Naphthoquinone, solids, recoverable, dry weight, micrograms per kilogram                                |
| 63240                 | 1-Naphthol, solids, recoverable, dry weight, micrograms per kilogram                                        |
| 63241                 | 2-(4-tert-Butylphenoxy)-cyclohexanol, solids, recoverable, dry weight, micrograms per kilogram              |
| 63242                 | 2,5-Dichloroaniline, solids, recoverable, dry weight, micrograms per kilogram                               |
| 63243                 | 2,6-Diethylaniline, solids, recoverable, dry weight, micrograms per kilogram                                |
| 63244                 | 2-[(2-Ethyl-6-methylphenyl)amino]-1-propanol, solids, recoverable, dry weight, micrograms per kilogram      |
| 63245                 | 2-Amino-N-isopropylbenzamide, solids, recoverable, dry weight, micrograms per kilogram                      |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 63246                 | 2-Chloro-2',6'-diethylacetanilide, solids, recoverable, dry weight, micrograms per kilogram                                         |
| 63247                 | 2-Ethyl-6-methylaniline, solids, recoverable, dry weight, micrograms per kilogram                                                   |
| 63248                 | 3,4-Dichloroaniline, solids, recoverable, dry weight, micrograms per kilogram                                                       |
| 63249                 | 3,4-Dichlorophenyl isocyanate, solids, recoverable, dry weight, micrograms per kilogram                                             |
| 63250                 | 3,5-Dichloroaniline, solids, recoverable, dry weight, micrograms per kilogram                                                       |
| 63251                 | 3-Phenoxybenzyl alcohol, solids, recoverable, dry weight, micrograms per kilogram                                                   |

| 64121                 | Phenanthridine, solids, recoverable, dry weight, micrograms per kilogram                                                                                                 |
| 64122                 | C1-128 Isomers, 2 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, naphthalene, solids, recoverable, dry weight, micrograms per kilogram                          |
| 64123                 | C2-128 Isomers, 2 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, naphthalene, solids, recoverable, dry weight, micrograms per kilogram                          |
| 64124                 | C3-128 Isomers, 2 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, naphthalene, solids, recoverable, dry weight, micrograms per kilogram                          |
| 64125                 | C4-128 Isomers, 2 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, naphthalene, solids, recoverable, dry weight, micrograms per kilogram                          |
| 64126                 | C5-128 Isomers, 2 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, naphthalene, solids, recoverable, dry weight, micrograms per kilogram                          |
| 64127                 | C1-178 Isomers, 3 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, phenanthrene/anthracene, solids, recoverable, dry weight, micrograms per kilogram              |
| 64128                 | C2-178 Isomers, 3 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, phenanthrene/anthracene, solids, recoverable, dry weight, micrograms per kilogram              |
| 64129                 | C3-178 Isomers, 3 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, phenanthrene/anthracene, solids, recoverable, dry weight, micrograms per kilogram              |
| 64130                 | C4-178 Isomers, 3 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, phenanthrene/anthracene, solids, recoverable, dry weight, micrograms per kilogram              |
| 64131                 | C5-178 Isomers, 3 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, phenanthrene/anthracene, solids, recoverable, dry weight, micrograms per kilogram              |
| 64132                 | C1-202 Isomers, condensed 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, fluoranthene/pyrene, solids, recoverable, dry weight, micrograms per kilogram        |
| 64133                 | C2-202 Isomers, condensed 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, fluoranthene/pyrene, solids, recoverable, dry weight, micrograms per kilogram        |
| 64134                 | C3-202 Isomers, condensed 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, fluoranthene/pyrene, solids, recoverable, dry weight, micrograms per kilogram        |
| 64135                 | C4-202 Isomers, condensed 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, fluoranthene/pyrene, solids, recoverable, dry weight, micrograms per kilogram        |
| 64136                 | C5-202 Isomers, condensed 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, fluoranthene/pyrene, solids, recoverable, dry weight, micrograms per kilogram        |
| 64137                 | C1-228 Isomers, extended 4 ring Polycyclic Aromatic Hydrocarbons (PAH), alkylated, benzo[a]anthracene/chrysene, solids, recoverable, dry weight, micrograms per kilogram |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                                    |

| 64187                 | 1,2-Dimethylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter              |
| 64188                 | 1,4-Dichlorobenzene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64189                 | 1,4-Naphthoquinone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                   |
| 64190                 | 1,6-Dimethylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter              |
| 64191                 | 1-Methyl-9H-fluorene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                 |
| 64192                 | 1-Methylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64193                 | 1-Methylphenanthrene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                 |
| 64194                 | 1-Methylpyrene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                       |
| 64195                 | 1-Naphthol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64196                 | 2-(4-tert-Butylphenoxy)-cyclohexanol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |
| 64197                 | 2,3,6-Trimethylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter           |
| 64198                 | 2,5-Dichloroaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64199                 | 2,6-Diethylaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                   |
| 64200                 | 2,6-Dimethylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter              |
| 64201                 | 2-Amino-N-isopropylbenzamide, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter         |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                  |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 64202                 | 2-Chloro-2',6'-diethylacetanilide, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter            |
| 64203                 | 2-Chloro-4-isopropylamino-6-amino-s-triazine, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |
| 64204                 | 2-Ethyl-6-methylaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                      |
| 64205                 | 2-Ethynaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                            |
| 64206                 | 2-Methylanthracene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64207                 | 2-Methylnaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                          |
| 64208                 | 3,4-Dichloroaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                          |
| 64209                 | 3,5-Dichloroaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                          |
| 64210                 | 3-beta-Coprostanol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64211                 | 3-Methyl-1H-indole, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64212                 | 3-tert-Butyl-4-hydroxyanisole, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                |
| 64213                 | 3-Trifluoromethylaniline, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                     |
| 64214                 | 4,4'-Dichlorobenzophenone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                    |
| 64215                 | 4-Chloro-2-methylphenol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                      |
| 64216                 | 4-Chlorobenzylmethylsulfone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64217                 | 4-Cumylphenol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                |
| 64218                 | 4H-Cyclopenta[def]phenanthrene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter               |
| 64219                 | 4-n-Octylphenol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                              |
| 64220                 | 4-tert-Octylphenol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64221                 | 5-Methyl-1H-benzotriazole, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                    |
| 64222                 | 9H-Fluorene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                  |
| 64223                 | Acenaphthene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                 |
| 64224                 | Acenaphthylene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                               |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 64225                 | Acetochlor, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                            |
| 64226                 | Acetophenone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                          |
| 64227                 | Acetylhexamethyltetrahydronaphthalene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |
| 64228                 | Alachlor, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                              |
| 64229                 | Aldrin, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                |
| 64230                 | alpha-HCH, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                             |
| 64231                 | Anthracene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                            |
| 64232                 | 9,10-Anthraquinone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                    |
| 64233                 | Atrazine, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                              |
| 64234                 | Azinphos-methyl, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                       |
| 64235                 | Azinphos-methyl oxygen analog, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter         |
| 64236                 | Benfluralin, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                           |
| 64237                 | Benzo[a]anthracene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                    |
| 64238                 | Benzo[a]pyrene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                        |
| 64239                 | Benzo[b]fluoranthene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64240                 | Benzo[e]pyrene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                        |
| 64241                 | Benzo[ghi]perylene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                    |
| 64242                 | Benzo[k]fluoranthene, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                  |
| 64243                 | Benzophenone, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                          |
| 64244                 | beta-HCH, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                              |
| 64245                 | beta-Sitosterol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                       |
| 64246                 | beta-Stigmastanol, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                     |
| 64247                 | Bifenthrin, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                            |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 64248                 | Bisphenol A, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                               |
| 64249                 | Bromacil, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                                  |
| 64250                 | Bromoform, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                                 |
| 64251                 | Butylate, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                                  |
| 64252                 | C1-128 Isomers, methylated naphthalenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                   |
| 64253                 | C1-178 Isomers, methylated phenanthrene/anthracenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter       |
| 64254                 | C1-202 Isomers, methylated fluoranthene/pyrenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter           |
| 64255                 | C1-228 Isomers, methylated benzo[a]anthracene/chrysenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter   |
| 64256                 | C1-252 Isomers, C1-methylated benzopyrene/perlyenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter       |
| 64257                 | C2-128 Isomers, C2-alkylated naphthalenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                 |
| 64258                 | C2-178 Isomers, C2-alkylated phenanthrene/anthracenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter     |
| 64259                 | C2-202 Isomers, C2-alkylated fluoranthene/pyrenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter         |
| 64260                 | C2-228 Isomers, C2-alkylated benzo[a]anthracene/chrysenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |
| 64261                 | C2-252 Isomers, C2-alkylated benzopyrene/perlyenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter        |
| 64262                 | C3-128 Isomers, C3-alkylated naphthalenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                 |
| 64263                 | C3-178 Isomers, C3-alkylated phenanthrene/anthracenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter     |
| 64264                 | C3-202 Isomers, C3-alkylated fluoranthene/pyrenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter         |
| 64265                 | C3-228 Isomers, C3-alkylated benzo[a]anthracene/chrysenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |
| 64266                 | C3-252 Isomers, C3-alkylated benzopyrene/perlyenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter        |
| 64267                 | C4-128 Isomers, C4-alkylated naphthalenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                 |
| 64268                 | C4-178 Isomers, C4-alkylated phenanthrene/anthracenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter     |
| 64269                 | C4-202 Isomers, C4-alkylated fluoranthene/pyrenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter         |
| 64270                 | C4-228 Isomers, C4-alkylated benzo[a]anthracene/chrysenes, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                               |

| 65209                 | Environmental (cells not digested) microcystin, unfiltered water, unextracted, ADDA specific ELISA, micrograms per liter          |
| 65210                 | Total microcystin, unfiltered water, freeze/thaw extraction, ADDA specific ELISA, micrograms per liter                            |
| 65211                 | Dissolved microcystin, filtered water, ADDA specific ELISA, micrograms per liter                                                  |
| 65212                 | Antimony, bed sediment, recoverable, dry weight, micrograms per gram                                                              |
| 65213                 | Thallium, bed sediment, recoverable, dry weight, micrograms per gram                                                              |
| 65214                 | Tungsten, bed sediment, recoverable, dry weight, micrograms per gram                                                              |
| 65215                 | Endothal, water, filtered, recoverable, micrograms per liter                                                                      |
| 65216                 | Fluridone, water, filtered, recoverable, micrograms per liter                                                                     |
| 65217                 | Octachlorostyrene, solids, recoverable, dry weight, micrograms per kilogram                                                       |
| 65218                 | Tetrachloro- through octachloro- polychlorinated naphthalenes (mixture), solids, recoverable, dry weight, micrograms per kilogram |
| 65219                 | 2,6-Dichloro-4-nitroaniline (dicloran), solids, recoverable, dry weight, micrograms per kilogram                                  |
| 65220                 | Bis(hexachlorocyclopentadieno) cyclooctane, solids, recoverable, dry weight, micrograms per kilogram                              |
| 65222                 | Carbon-14 in organic carbon 1-sigma uncertainty, water, filtered, percent modern                                                  |
| 65224                 | Carbon-13/Carbon-12 ratio in organic carbon 1-sigma uncertainty, water, filtered, per mil                                         |
| 65226                 | Perfluorooctane sulfonate, water, unfiltered, recoverable, nanograms per liter                                                    |
| 65227                 | Perfluorooctanoic acid, water, unfiltered, recoverable, nanograms per liter                                                       |
| 65228                 | Chlorophyll b, water, unfiltered, trichromatic method, uncorrected, micrograms per liter                                          |
| 65229                 | Chlorophyll c, water, unfiltered, trichromatic method, uncorrected, micrograms per liter                                          |
| 65231                 | Chlorophyll a, water, in situ, in vivo fluorescence, micrograms per liter                                                         |
| 65232                 | Tin, bed sediment, recoverable, dry weight, micrograms per gram                                                                   |
| 65233                 | Terbutylazine, water, recoverable, nanograms per semipermeable membrane device                                                    |
| 65234                 | 2,7-Dimethylnaphthalene, bed sediment, recoverable, dry weight, micrograms per kilogram                                           |
| 65235                 | 1-Methylnaphthalene, bed sediment, recoverable, dry weight, micrograms per kilogram                                               |
| 65236                 | 2-Methylnaphthalene, bed sediment, recoverable, dry weight, micrograms per kilogram                                               |
| 65238                 | Sulfur, bed sediment, total digestion, dry weight, milligrams per kilogram                                                        |
| 65239                 | Formate, water, filtered (0.2 micron filter), recoverable, milligrams per liter                                                   |
| 65240                 | Acetate, water, filtered (0.2 micron filter), recoverable, milligrams per liter                                                   |
| 65246                 | Azoxystrobin, water, filtered, recoverable, micrograms per liter                                                                  |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| 65247                 | Boscalid, water, filtered, recoverable, micrograms per liter                                                  |
| 65248                 | Cyproconazole, water, filtered, recoverable, micrograms per liter                                             |
| 65249                 | Metconazole, water, filtered, recoverable, micrograms per liter                                               |
| 65250                 | Pyraclostrobin, water, filtered, recoverable, micrograms per liter                                            |
| 65251                 | Tetraconazole, water, filtered, recoverable, micrograms per liter                                             |
| 65252                 | Trifloxystrobin, water, filtered, recoverable, micrograms per liter                                           |
| 65253                 | Perylene, water, unfiltered, recoverable, micrograms per liter                                                |
| 65254                 | 2,4-Dinitrotoluene, solids, recoverable, dry weight, micrograms per kilogram                                  |
| 65255                 | 11-Ketotestosterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                          |
| 65256                 | 17-alpha-Estradiol, biota, tissue, recoverable, wet weight, micrograms per kilogram                           |
| 65257                 | 17-alpha-Ethynodiol, biota, tissue, recoverable, wet weight, micrograms per kilogram                          |
| 65258                 | 17-beta-Estradiol, biota, tissue, recoverable, wet weight, micrograms per kilogram                            |
| 65259                 | Norethindrone, biota, tissue, recoverable, wet weight, micrograms per kilogram                                |
| 65260                 | 3-beta-Coprostanol, biota, tissue, recoverable, wet weight, micrograms per kilogram                           |
| 65261                 | 4-Androstene-3,17-dione, biota, tissue, recoverable, wet weight, micrograms per kilogram                      |
| 65262                 | Cholesterol, biota, tissue, recoverable, wet weight, micrograms per kilogram                                  |
| 65263                 | cis-Androsterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                             |
| 65264                 | trans-Diethylstilbestrol, biota, tissue, recoverable, wet weight, micrograms per kilogram                     |
| 65265                 | Epitestosterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                              |
| 65266                 | Equilenin, biota, tissue, recoverable, wet weight, micrograms per kilogram                                    |
| 65267                 | Equilin, biota, tissue, recoverable, wet weight, micrograms per kilogram                                      |
| 65268                 | Estriol, biota, tissue, recoverable, wet weight, micrograms per kilogram                                      |
| 65269                 | Estrone, biota, tissue, recoverable, wet weight, micrograms per kilogram                                      |
| 65270                 | Mestranol, biota, tissue, recoverable, wet weight, micrograms per kilogram                                    |
| 65271                 | Progesterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                                 |
| 65272                 | Dihydrotestosterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                          |
| 65273                 | Testosterone, biota, tissue, recoverable, wet weight, micrograms per kilogram                                 |
| 65274                 | Trenbolone, biota, tissue, recoverable, wet weight, micrograms per kilogram                                   |
| 65275                 | 11-Ketotestosterone, water, recoverable, nanograms per polar organic chemical integrative sampler (POCIS)     |
| 65276                 | 17-alpha-Estradiol, water, recoverable, nanograms per polar organic chemical integrative sampler (POCIS)      |
| 65277                 | 17-alpha-Ethynodiol, water, recoverable, nanograms per polar organic chemical integrative sampler (POCIS)     |

| 65508                 | C5-202 Isomers, C5-alkylated fluoranthenes/pyrenes, air, top plus bottom sorbent trap, recoverable, nanograms per cubic meter         |
| 65509                 | C5-228 Isomers, C5-alkylated benzo[a]anthracenes/chrysenes, air, top plus bottom sorbent trap, recoverable, nanograms per cubic meter |
| 65510                 | C5-252 Isomers, C5-alkylated benzopyrenes/perylenes, air, top plus bottom sorbent trap, recoverable, nanograms per cubic meter        |
| 65511                 | 1,4-Naphthoquinone, air, particulate filter, recoverable, nanograms per cubic meter                                                   |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| 65512                 | 1-Naphthol, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65513                 | 2-(4-tert-Butylphenoxy)-cyclohexanol, air, particulate filter, recoverable, nanograms per cubic meter         |
| 65514                 | 2,5-Dichloroaniline, air, particulate filter, recoverable, nanograms per cubic meter                          |
| 65515                 | 2,6-Diethylaniline, air, particulate filter, recoverable, nanograms per cubic meter                           |
| 65516                 | 2-Amino-N-isopropylbenzamide, air, particulate filter, recoverable, nanograms per cubic meter                 |
| 65517                 | 2-Chloro-2',6'-diethylacetanilide, air, particulate filter, recoverable, nanograms per cubic meter            |
| 65518                 | 2-Chloro-4-isopropylamino-6-amino-s-triazine, air, particulate filter, recoverable, nanograms per cubic meter |
| 65519                 | 2-Ethyl-6-methylaniline, air, particulate filter, recoverable, nanograms per cubic meter                      |
| 65520                 | 3,4-Dichloroaniline, air, particulate filter, recoverable, nanograms per cubic meter                          |
| 65521                 | 3,5-Dichloroaniline, air, particulate filter, recoverable, nanograms per cubic meter                          |
| 65522                 | 3-Trifluoromethylaniline, air, particulate filter, recoverable, nanograms per cubic meter                     |
| 65523                 | 4,4'-Dichlorobenzophenone, air, particulate filter, recoverable, nanograms per cubic meter                    |
| 65524                 | 4-Chloro-2-methylphenol, air, particulate filter, recoverable, nanograms per cubic meter                      |
| 65525                 | 4-Chlorobenzylmethylsulfone, air, particulate filter, recoverable, nanograms per cubic meter                  |
| 65526                 | Acetochlor, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65527                 | Alachlor, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65528                 | alpha-HCH, air, particulate filter, recoverable, nanograms per cubic meter                                    |
| 65529                 | Atrazine, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65530                 | Azinphos-methyl, air, particulate filter, recoverable, nanograms per cubic meter                              |
| 65531                 | Azinphos-methyl oxygen analog, air, particulate filter, recoverable, nanograms per cubic meter                |
| 65532                 | Benfluralin, air, particulate filter, recoverable, nanograms per cubic meter                                  |
| 65533                 | Bifenthrin, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65534                 | Butylate, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65535                 | Carbaryl, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65536                 | Carbofuran, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65537                 | Chlorpyrifos, air, particulate filter, recoverable, nanograms per cubic meter                                 |
| 65538                 | Chlorpyrifos oxygen analog, air, particulate filter, recoverable, nanograms per cubic meter                   |
| 65539                 | cis-Permethrin, air, particulate filter, recoverable, nanograms per cubic meter                               |
| 65540                 | cis-Propiconazole, air, particulate filter, recoverable, nanograms per cubic meter                            |
| 65541                 | Cyanazine, air, particulate filter, recoverable, nanograms per cubic meter                                    |
| 65542                 | Cycloate, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65543                 | Cyfluthrin, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65544                 | Cypermethrin, air, particulate filter, recoverable, nanograms per cubic meter                                 |
| 65545                 | DCPA, air, particulate filter, recoverable, nanograms per cubic meter                                         |
| 65546                 | Desulfinylfipronil, air, particulate filter, recoverable, nanograms per cubic meter                           |
| 65547                 | Desulfinylfipronil amide, air, particulate filter, recoverable, nanograms per cubic meter                     |
| 65548                 | Diazinon, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65549                 | Diazoxon, air, particulate filter, recoverable, nanograms per cubic meter                                     |
| 65550                 | Dichlorvos, air, particulate filter, recoverable, nanograms per cubic meter                                   |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                  |
|-----------------------|----------------------------------------------------------------------------------------|
| 65551                 | Dicrotophos, air, particulate filter, recoverable, nanograms per cubic meter           |
| 65552                 | Dieldrin, air, particulate filter, recoverable, nanograms per cubic meter              |
| 65553                 | Dimethoate, air, particulate filter, recoverable, nanograms per cubic meter            |
| 65554                 | (E)-Dimethomorph, air, particulate filter, recoverable, nanograms per cubic meter      |
| 65555                 | (Z)-Dimethomorph, air, particulate filter, recoverable, nanograms per cubic meter      |

| 65618                 | Tebupirimphos, air, particulate filter, recoverable, nanograms per cubic meter                             |
| 65619                 | Tebupirimphos oxygen analog, air, particulate filter, recoverable, nanograms per cubic meter               |
| 65620                 | Tebuthiuron, air, particulate filter, recoverable, nanograms per cubic meter                               |
| 65621                 | Tefluthrin, air, particulate filter, recoverable, nanograms per cubic meter                                |
| 65622                 | Temephos, air, particulate filter, recoverable, nanograms per cubic meter                                  |
| 65623                 | Terbacil, air, particulate filter, recoverable, nanograms per cubic meter                                  |
| 65624                 | Terbufos, air, particulate filter, recoverable, nanograms per cubic meter                                  |
| 65625                 | Terbufos oxygen analog sulfone, air, particulate filter, recoverable, nanograms per cubic meter            |
| 65626                 | Terbutylazine, air, particulate filter, recoverable, nanograms per cubic meter                             |
| 65627                 | Thiobencarb, air, particulate filter, recoverable, nanograms per cubic meter                               |
| 65628                 | trans-Propiconazole, air, particulate filter, recoverable, nanograms per cubic meter                       |
| 65629                 | Triallate, air, particulate filter, recoverable, nanograms per cubic meter                                 |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------|
| 65630                 | Tribufos, air, particulate filter, recoverable, nanograms per cubic meter                                   |
| 65631                 | Trifluralin, air, particulate filter, recoverable, nanograms per cubic meter                                |
| 65632                 | 1,4-Naphthoquinone, air, top sorbent trap, recoverable, nanograms per cubic meter                           |
| 65633                 | 1-Naphthol, air, top sorbent trap, recoverable, nanograms per cubic meter                                   |
| 65634                 | 2-(4-tert-Butylphenoxy)-cyclohexanol, air, top sorbent trap, recoverable, nanograms per cubic meter         |
| 65635                 | 2,5-Dichloroaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                          |
| 65636                 | 2,6-Diethylaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                           |
| 65637                 | 2-Amino-N-isopropylbenzamide, air, top sorbent trap, recoverable, nanograms per cubic meter                 |
| 65638                 | 2-Chloro-2',6'-diethylacetanilide, air, top sorbent trap, recoverable, nanograms per cubic meter            |
| 65639                 | 2-Chloro-4-isopropylamino-6-amino-s-triazine, air, top sorbent trap, recoverable, nanograms per cubic meter |
| 65640                 | 2-Ethyl-6-methylaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                      |
| 65641                 | 3,4-Dichloroaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                          |
| 65642                 | 3,5-Dichloroaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                          |
| 65643                 | 3-Trifluoromethylaniline, air, top sorbent trap, recoverable, nanograms per cubic meter                     |
| 65644                 | 4,4'-Dichlorobenzophenone, air, top sorbent trap, recoverable, nanograms per cubic meter                    |
| 65645                 | 4-Chloro-2-methylphenol, air, top sorbent trap, recoverable, nanograms per cubic meter                      |
| 65646                 | 4-Chlorobenzylmethylsulfone, air, top sorbent trap, recoverable, nanograms per cubic meter                  |
| 65647                 | Acetochlor, air, top sorbent trap, recoverable, nanograms per cubic meter                                   |
| 65648                 | Alachlor, air, top sorbent trap, recoverable, nanograms per cubic meter                                     |
| 65649                 | alpha-HCH, air, top sorbent trap, recoverable, nanograms per cubic meter                                    |
| 65650                 | Atrazine, air, top sorbent trap, recoverable, nanograms per cubic meter                                     |
| 65651                 | Azinphos-methyl, air, top sorbent trap, recoverable, nanograms per cubic meter                              |
| 65652                 | Azinphos-methyl oxygen analog, air, top sorbent trap, recoverable, nanograms per cubic meter                |
| 65653                 | Benfluralin, air, top sorbent trap, recoverable, nanograms per cubic meter                                  |
| 65654                 | Bifenthrin, air, top sorbent trap, recoverable, nanograms per cubic meter                                   |
| 65655                 | Butylate, air, top sorbent trap, recoverable, nanograms per cubic meter                                     |
| 65656                 | Carbaryl, air, top sorbent trap, recoverable, nanograms per cubic meter                                     |
| 65657                 | Carbofuran, air, top sorbent trap, recoverable, nanograms per cubic meter                                   |
| 65658                 | Chlorpyrifos, air, top sorbent trap, recoverable, nanograms per cubic meter                                 |
| 65659                 | Chlorpyrifos oxygen analog, air, top sorbent trap, recoverable, nanograms per cubic meter                   |
| 65660                 | cis-Permethrin, air, top sorbent trap, recoverable, nanograms per cubic meter                               |
| 65661                 | cis-Propiconazole, air, top sorbent trap, recoverable, nanograms per cubic meter                            |
| 65662                 | Cyanazine, air, top sorbent trap, recoverable, nanograms per cubic meter                                    |
| 65663                 | Cycloate, air, top sorbent trap, recoverable, nanograms per cubic meter                                     |
| 65664                 | Cyfluthrin, air, top sorbent trap, recoverable, nanograms per cubic meter                                   |
| 65665                 | Cypermethrin, air, top sorbent trap, recoverable, nanograms per cubic meter                                 |
| 65666                 | DCPA, air, top sorbent trap, recoverable, nanograms per cubic meter                                         |
| 65667                 | Desulfinylfipronil, air, top sorbent trap, recoverable, nanograms per cubic meter                           |
| 65668                 | Desulfinylfipronil amide, air, top sorbent trap, recoverable, nanograms per cubic meter                     |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                |
|-----------------------|--------------------------------------------------------------------------------------|

| 66662                 | Trifloxystrobin, bed sediment, recoverable, dry weight, micrograms per kilogram                                                                           |
| 66663                 | RDX, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                          |
| 66664                 | HMX, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                          |
| 66665                 | 1,3,5-Trinitrobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram        |
| 66666                 | 1,3-Dinitrobenzene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram           |
| 66667                 | TNT, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                          |
| 66668                 | 2-Nitrotoluene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 66669                 | 3-Nitrotoluene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 66670                 | 4-Nitrotoluene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 66671                 | Nitroglycerin, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 66672                 | Pentaerythritol tetranitrate, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 66673                 | 1,1'-Biphenyl, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 66674                 | 2,4,5-Trichlorophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram        |
| 66675                 | 2,4-Dimethylphenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram           |
| 66676                 | 2-Methylnaphthalene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram          |
| 66677                 | 3,3'-Dichlorobenzidine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram       |
| 66678                 | 4-Chloroaniline, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram              |
| 66679                 | 4-Nitrophenol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 66680                 | alpha-Terpineol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram              |
| 66681                 | Atrazine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                     |
| 66682                 | Benzaldehyde, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                 |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 66683                 | Dibenzofuran, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram               |
| 66684                 | Diphenylamine, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram              |
| 66685                 | m-Cresol plus p-Cresol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram     |
| 66686                 | 3-Nitroaniline, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram             |
| 66687                 | o-Cresol, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                   |
| 66688                 | 2-Nitroaniline, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram             |
| 66689                 | 4-Nitroaniline, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram             |
| 66690                 | 2-Amino-4,6-dinitrotoluene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 66691                 | 4-Amino-2,6-dinitrotoluene, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram |
| 66693                 | Tetryl, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                     |
| 66694                 | Perchlorate, bed sediment smaller than 2 millimeters, wet sieved (native water), field, recoverable, dry weight, micrograms per kilogram                |
| 66695                 | Tebuconazole, air, bottom sorbent trap, recoverable, nanograms per cubic meter                                                                          |
| 66696                 | Tebuconazole, air, particulate filter, recoverable, nanograms per cubic meter                                                                           |
| 66697                 | Tebuconazole, air, sum of particulate filter plus top and bottom sorbent traps, recoverable, nanograms per cubic meter                                  |
| 66698                 | Tebuconazole, air, top plus bottom sorbent trap, recoverable, nanograms per cubic meter                                                                 |
| 66699                 | Tebuconazole, air, top sorbent trap, recoverable, nanograms per cubic meter                                                                             |
| 66700                 | Absorbance, UV, organic constituents, 412 nm, 1 cm pathlength, water, filtered, units per centimeter                                                    |
| 66701                 | Bis(hexachlorocyclopentadieno) cyclooctane, biota, tissue, recoverable, wet weight, micrograms per kilogram                                             |
| 66702                 | Chemical oxygen demand, solids, total, dry weight, milligrams per liter                                                                                 |

| 73522                 | Bis(2-chloroisopropyl) ether, water, unfiltered, recoverable, micrograms per liter                                                                                         |
| 73530                 | Chloromethyl methyl ether, water, unfiltered, recoverable, micrograms per liter                                                                                            |
| 73547                 | trans-1,4-Dichloro-2-butene, water, unfiltered, recoverable, micrograms per liter                                                                                          |

| <b>Parameter code</b> | <b>Parameter name</b>                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| 73558                 | 4-Dimethylaminoazobenzene, water, unfiltered, recoverable, micrograms per liter                               |
| 73559                 | 7,12-Dimethylbenzo[a]anthracene, water, unfiltered, recoverable, micrograms per liter                         |
| 73560                 | 3,3'-Dimethylbenzidine, water, unfiltered, recoverable, micrograms per liter                                  |
| 73564                 | alpha,alpha-Dimethylphenethylamine, water, unfiltered, recoverable, micrograms per liter                      |
| 73570                 | Ethyl methacrylate, water, unfiltered, recoverable, micrograms per liter                                      |
| 73571                 | Ethyl methanesulfonate, water, unfiltered, recoverable, micrograms per liter                                  |
| 73576                 | Hexachloropropene, water, unfiltered, recoverable, micrograms per liter                                       |
| 73582                 | Isosafrole, water, unfiltered, recoverable, micrograms per liter                                              |
| 73589                 | Methapyrilene, water, unfiltered, recoverable, micrograms per liter                                           |
| 73595                 | Methyl methanesulfonate, water, unfiltered, recoverable, micrograms per liter                                 |
| 73598                 | Bis(2-chloroethyl) sulfide, water, unfiltered, recoverable, micrograms per liter                              |
| 73599                 | 1,4-Naphthoquinone, water, unfiltered, recoverable, micrograms per liter                                      |
| 73600                 | 1-Naphthylamine, water, unfiltered, recoverable, micrograms per liter                                         |
| 73613                 | N-Nitrosomethylamine, water, unfiltered, recoverable, micrograms per liter                                    |
| 73617                 | N-Nitrosomorpholine, water, unfiltered, recoverable, micrograms per liter                                     |
| 73619                 | N-Nitrosopiperidine, water, unfiltered, recoverable, micrograms per liter                                     |
| 73622                 | 5-Nitro-o-toluidine, water, unfiltered, recoverable, micrograms per liter                                     |
| 73626                 | Phenacetin, water, unfiltered, recoverable, micrograms per liter                                              |
| 73652                 | O,O,O-Triethyl phosphorothioate, water, unfiltered, recoverable, micrograms per liter                         |
| 73653                 | 1,3,5-Trinitrobenzene, water, unfiltered, recoverable, micrograms per liter                                   |
| 75031                 | Zirconium, niobium-95, counting error, water, unfiltered, picocuries per liter                                |
| 75037                 | Potassium-40 counting error, water, unfiltered, picocuries per liter                                          |
| 75936                 | Thorium-232 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                 |
| 75941                 | Uranium-234 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                 |
| 75943                 | Radium-226 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                  |
| 75945                 | Polonium-210 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                |
| 75947                 | Uranium-235 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                 |
| 75948                 | Radium-228 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                  |
| 75949                 | Lead-210 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                    |
| 75952                 | Thorium-230 2-sigma combined uncertainty, suspended sediment, dry weight, picocuries per gram                 |
| 75955                 | Alpha radioactivity 2-sigma combined uncertainty, bed sediment, Th-230 curve, dry weight, picocuries per gram |
| 75960                 | Cesium-137 2-sigma combined uncertainty, bed sediment, dry weight, picocuries per gram                        |
| 75962                 | Uranium-238 2-sigma combined uncertainty, bed sediment, dry weight, picocuries per gram                       |

| 99325                 | Radium-226 sample-specific minimum detectable concentration, water, filtered, picocuries per liter                                    |
| 99326                 | Radium-228 sample-specific minimum detectable concentration, water, filtered, picocuries per liter                                    |
| 99327                 | Radon-222 sample-specific minimum detectable concentration, water, unfiltered, picocuries per liter                                   |
| 99337                 | Gross alpha radioactivity 2X critical level (sample-specific minimum detectable concentration), water, filtered, picocuries per liter |
| 99401                 | Dissolved solids, water, filtered, estimated by regression equation, milligrams per liter                                             |
| 99402                 | Suspended solids, water, unfiltered, estimated by regression equation, milligrams per liter                                           |
| 99403                 | Total solids, water, unfiltered, estimated by regression equation, milligrams per liter                                               |
| 99404                 | Chloride, water, filtered, estimated by regression equation, milligrams per liter                                                     |
| 99405                 | Sulfate, water, filtered, estimated by regression equation, milligrams per liter                                                      |
| 99408                 | Atrazine, water, filtered, estimated by regression equation, micrograms per liter                                                     |
| 99409                 | Suspended sediment concentration, water, unfiltered, estimated by regression equation, milligrams per liter                           |
| 99410                 | Total nitrogen, water, filtered, estimated by regression equation, milligrams per liter                                               |
| 99416                 | Phosphorus, water, unfiltered, estimated by regression equation, milligrams per liter                                                 |
| 99440                 | Bicarbonate, water, unfiltered, inflection-point titration method (incremental titration method), field, milligrams per liter         |
| 99773                 | Fluometuron, water, filtered, immunoassay, unadjusted, recoverable, micrograms per liter                                              |
| 99774                 | Metribuzin, water, filtered, immunoassay, unadjusted, recoverable, micrograms per liter                                               |
| 99775                 | Atrazine, water, filtered, immunoassay, unadjusted, recoverable, micrograms per liter                                                 |
| 99782                 | Boron, water, filtered, unpreserved, recoverable, micrograms per liter                                                                |
| 99783                 | N-Nitrosodimethylamine, expected spike concentration, water, micrograms per liter                                                     |
| 99784                 | 1,2,3-Trichloropropane, expected spike concentration, water, micrograms per liter                                                     |
| 99785                 | 1,4-Dioxane, expected spike concentration, water, micrograms per liter                                                                |
| 99786                 | Perchlorate, expected spike concentration, water, micrograms per liter                                                                |
| 99830                 | Hydroxide, water, unfiltered, inflection-point titration method (incremental titration method), field, milligrams per liter           |
| 99841                 | Sample weight, semipermeable membrane device, grams                                                                                   |
| 99889                 | Nitrate plus nitrite, water, filtered, field, milligrams per liter as nitrogen                                                        |
| 99890                 | Sulfate, water, filtered, uncorrected, milligrams per liter                                                                           |
| 99891                 | Phosphorus, water, unfiltered, modified jirka method, milligrams per liter                                                            |
| 99893                 | Phosphorus, water, filtered, modified jirka method, milligrams per liter                                                              |
| 99895                 | Silver, water, unfiltered, EPA contract, recoverable, micrograms per liter                                                            |
| 99896                 | Cyanide, water, unfiltered, EPA contract, recoverable, milligrams per liter                                                           |
| 99897                 | Antimony, water, unfiltered, EPA contract, recoverable, micrograms per liter                                                          |
| 99960                 | Glyphosate, water, filtered, immunoassay, unadjusted, recoverable, micrograms per liter                                               |
| 99977                 | Dissolved oxygen, water, unfiltered, 1 meter below surface, milligrams per liter                                                      |
| 99981                 | Dissolved oxygen, water, unfiltered, 1 meter above bottom, milligrams per liter                                                       |
| 99985                 | Dissolved oxygen, water, unfiltered, mid-depth, milligrams per liter                                                                  |

## 4.10 Appendix J. Time-Related Codes

**Table 1. Time datum codes.**

| Time datum code                    | Time datum name                 | Offset from UTC (hours) |
|------------------------------------|---------------------------------|-------------------------|
| <b>Commonly used time datums</b>   |                                 |                         |
| ADT                                | Atlantic daylight time          | -03:00                  |
| AKDT                               | Alaska daylight time            | -08:00                  |
| AKST                               | Alaska standard time            | -09:00                  |
| AST                                | Atlantic standard time (Canada) | -04:00                  |
| CDT                                | Central daylight time           | -05:00                  |
| CST                                | Central standard time           | -06:00                  |
| EDT                                | Eastern daylight time           | -04:00                  |
| EST                                | Eastern standard time           | -05:00                  |
| GMT                                | Greenwich mean time             | 00:00                   |
| HDT                                | Hawaii daylight time            | -09:00                  |
| HST                                | Hawaii standard time            | -10:00                  |
| MDT                                | Mountain daylight time          | -06:00                  |
| MST                                | Mountain standard time          | -07:00                  |
| PDT                                | Pacific daylight time           | -07:00                  |
| PST                                | Pacific standard time           | -08:00                  |
| UTC                                | Coordinated universal time      | 00:00                   |
| ZP11                               | GMT +11 hours                   | +11:00                  |
| ZP-11                              | GMT -11 hours                   | -11:00                  |
| ZP-2                               | GMT -2 hours                    | -02:00                  |
| ZP-3                               | GMT -3 hours                    | -03:00                  |
| ZP4                                | GMT +4 hours                    | +04:00                  |
| ZP5                                | GMT +5 hours                    | +05:00                  |
| ZP6                                | GMT +6 hours                    | +06:00                  |
| <b>Other time datums available</b> |                                 |                         |
| ACSST                              | Central Australia summer time   | +10:30                  |
| ACST                               | Central Australia standard time | +09:30                  |
| AESST                              | Australia Eastern summer time   | +11:00                  |
| AEST                               | Australia Eastern standard time | +10:00                  |
| AWSST                              | Australia Western summer time   | +09:00                  |
| AWST                               | Australia Western standard time | +08:00                  |

|        |                                    |        |
|--------|------------------------------------|--------|
| BST    | British summer time                | +01:00 |
| BT     | Baghdad time                       | +03:00 |
| CADT   | Central Australia daylight time    | +10:30 |

**Table 2. Time datum reliability codes.**

| Time datum reliability code | Description                                                                                                                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E                           | <p>Estimated (assumed) time datum. This code would be an option during interactive or batch sample input.</p> <p><i>*If this code is used the associated time datum will not appear for the sample on several output reports unless the time datum is requested specifically</i></p> |
| K                           | <p>Known time datum. This code would be the default during either interactive or batch sample login.</p>                                                                                                                                                                             |
| T                           | <p>Time datum assumed during data transfer. This should only be set during data transfer</p> <p><i>*If this code is used the associated time datum will not appear for the sample on several output reports unless the time datum is requested specifically</i></p>                  |

## 4.11 Appendix K. Protocol Organization Codes

[Note: Can be entered for analyzing entity (result level) or collecting agency (sample level) fields. If code appears in italics in the table, it is not allowed for new data entry]

| <b>Protocol organization code</b> | <b>Protocol organization name</b>                              | <b>Historical fixed value code</b> |

## 4.12 Appendix L. Parameters Used in the Standard Ion-Balance Table

**Note:** This table lists the parameters that can be included in an ion-balance table by NWIS. The parameters listed under each ion code are ordered with the most preferred parameter first. The concentration of each selected parameter result is multiplied by the **Factor** to convert to milliequivalents per liter before inclusion in the ionic balance. If an ion does not have results for any of the listed parameters, then one result from each of the subsequent ion codes preceded by an ellipsis (...) is summed to compute the value used for that ion. For example, if none of the parameters listed for Alkalinity are present for the sample, then the Alkalinity contribution is computed from the most preferred result for each of HCO<sub>3</sub>, plus CO<sub>3</sub>, plus OH. The software requires at least one anion and one cation before a balance will be produced. The parameter 00191—Hydrogen Ion will be automatically calculated from stored result values (when needed results are present for the algorithm) for inclusion in the ion-balance table. Other parameters, such as 00618—Nitrate, will not be calculated in the standard ion-balance.

## 4.13 Appendix M. Data Validation and Verification Checks

### Calculated Parameters Comparison

For all calculated parameters (see [Appendix D](#)), a check will be completed that compares any stored results with the rounded calculated value (if it can be calculated). If the values do not agree, a warning message is printed. An example message: “Stored Diss. solids, calcd (70301) is 235 and does not agree with computed value (250).”

Table 1. Data validation checks.

| Field                       | Tests performed                                                                                                                                                                                                                                                                                                                                                                                         | Message                                                                                                 |

## 4.14 Appendix N. Parameter-Sequence Group Codes for Retrieval

| Parameter-sequence group code | Parameter-sequence group short name | Parameter-sequence group description                                                                                                                                                                                                                                                                      |
|-------------------------------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INF                           | Information                         | Information about a data-collection site, sampling activity, analytical procedure, or quality-assurance measurement (Evaluation order 18)                                                                                                                                                                 |
| PHY                           | Physical                            | General quantitative and qualitative observations as well as results computed from field and laboratory observations (Evaluation order 12)                                                                                                                                                                |
| INM                           | Inorganics, Major, Metals           | Major metallic cations (including sodium, calcium, magnesium, and potassium); generally present in concentrations of milligrams per liter. (Evaluation order 4)                                                                                                                                           |
| INN                           | Inorganics, Major, Non-metals       | Major non-metallic anions (including chloride, fluoride, sulfate, and alkalinity related); generally present in concentrations of milligrams per liter. (Evaluation order 5)                                                                                                                              |
| NUT                           | Nutrient                            | Nitrogen- or phosphorus-based constituents. (Evaluation order 3)                                                                                                                                                                                                                                          |
| MBI                           | Microbiological                     | Bacteria, viruses, protozoans, or other microbial constituents. (Evaluation order 14)                                                                                                                                                                                                                     |
| BIO                           | Biological                          | Algal and zooplankton constituents (including productivity, chlorophyll, and biomass). Information about biological samples (for example, sample size and weight parameters), including tissue samples, are grouped as Biological. (Evaluation order 17)                                                  |
| IMM                           | Inorganics, Minor, Metals           | Trace metal cations or metal-based compounds; generally present in micrograms per liter. (Evaluation order 6)                                                                                                                                                                                             |
| IMN                           | Inorganics, Minor, Non-metals       | Trace non-metallic elements or non-metallic based compounds, generally present in micrograms per liter. (Evaluation order 7)                                                                                                                                                                              |
| OPE                           | Organics, Pesticide                 | Organic pesticide compounds, including their break-down products. When a chemical compound has more than one use, if the predominant use is for pesticides, it is assigned to this group; if the predominant use is other than as a pesticide, it is assigned to "Organics, other". (Evaluation order 10) |

## 5 Tip Sheets

## 5.1 Tip Sheet: How do I move around on the screens?

- ❖ You can use the <Enter> key to move through the fields one by one on any QWDATA screen. You must include an entry for fields that are mandatory (highlighted).
- ❖ In addition to the <Enter> key, special keystroke combinations are available to save time during data entry.

### Cursor controls

| <u>Keystroke</u> | <u>Resulting Action</u>                                                                             |
|------------------|-----------------------------------------------------------------------------------------------------|
| <b>^D</b>        | <b>(Ctrl-D) Skip to next block</b>                                                                  |
| <b>#</b>         | <b>Delete (clear) entry in field<br/>[NOTE: used as null value indicator in data entry screens]</b> |
| <b>/</b>         | <b>Move back one field</b>                                                                          |
| <b>/x</b>        | <b>Continue at item number x</b>                                                                    |
| <b>/+x</b>       | <b>Move forward (x) items, default x is 1</b>                                                       |
| <b>/-x</b>       | <b>Move back (x) items, default x is 1</b>                                                          |
| <b>/@</b>        | <b>Continue at item with string @ in label</b>                                                      |
| <b>/p</b>        | <b>Back up to previous page (screen)</b>                                                            |
| <b>/n</b>        | <b>Advance to next page (screen)</b>                                                                |
| <b>/d</b>        | <b>Delete current parameter</b>                                                                     |
| <b>/a</b>        | <b>Insert new parameter</b>                                                                         |
| <b>/c</b>        | <b>Cancel editing of current record – no changes are saved</b>                                      |
| <b>/q</b>        | <b>Skip remaining items – changes are saved</b>                                                     |

- ❖ Type a ?/ to show the list above on the screen.
- ❖ All of these control options are not available on each screen within QWDATA. Available cursor controls are shown on the bottom of the screens within the program.
- ❖ When the cursor is in the Method Code Field, the "/+" and "/-" options move the cursor to the next or previous block of result information, respectively. In other fields, these options move the cursor forward or backward the specified number of items."
- ❖ The "/x" option moves the cursor to the specified item or field within an item. For example "/3" moves the cursor to parameter number 3; "/dqi" moves the cursor to the DQI field.

## 5.2 Tip Sheet: How do I manually login my sample and enter field data?

**Note :** The sampling site must exist in the NWIS Sitefile before samples can be logged in or water-quality data can be entered. The program for adding a new site to the NWIS database is described in [Section 3.7.2--Add new site or modify site information](#). Access to this program may be restricted to more experienced database users.

- ❖ Choose option 1 from the main QWDATA menu.
- ❖ Items required to login a sample are highlighted on the screen and include: agency code, station number, begin date, time datum, time datum reliability code, medium code, sample type, analysis status, hydrologic condition, and hydrologic event. The items are sometimes referred to as the sample header information and are described in [Section 3.1](#).
- ❖ If you are entering a tissue sample with a medium code of BA, BP, BAQ or BPQ, the organism and body part codes become mandatory fields.
- ❖ You can search the valid codes for most of the items on this screen by typing "?" in the first column after the item.
- ❖ After entering the sample header information, you are asked: ***Do you want to enter any data for this record (Y/N)?***
- ❖ If you respond with an "***N***", a record number is generated. You may want to keep track of this record number on your field sheet or another location for future reference.
- ❖ If you respond with a "***Y***", the following query appears:  
***Are you entering lab (L) or field (F) data? (L or F, <CR>=F)?***
  - ❖ If ***F*** is chosen, the program described in [Section 3.2.1](#) is initiated and you are asked: ***Enter field form nn, ?nn for detail of form nn, ? for list of forms available.***
  - ❖ If ***L*** is chosen, the program described in [Section 3.2.2](#) is initiated and you are asked: ***Enter field form nn, ?nn for detail of form nn, ? for list of forms available.***
- ❖ The "***nn***" in the prompt refers to the field form number contained in the file name: ***field.parmsnn***, stored in the directory ***/usr/local/nwis/data/auxdata/qw\_field\_forms/***, where "***nn***" represents the 2-digit form number (e.g. ***field.parms01***).
  - Information about adding and designing a field form is available in [Section 2.10](#) and [Tip Sheet 5.3](#).
- ❖ If you choose to enter field data (short form) and enter a field form number, you can enter the data value, rounding precision, data-value remark, data quality indicator (DQI), null-value qualifier, value qualifiers, and result field comments for each of the parameters in the field form, which are described in [Section 3.2.1](#).
- ❖ If you choose to enter laboratory data (long form) and enter a field form number, in addition to the fields listed above, you can also enter information about the reporting level used, the preparatory set number and date; the analytical set number and date; and result field and result laboratory comments for each of the parameters in the field form, which are described in [Section 3.2.2](#).

- ❖ Cursor control characters and options shown at the bottom of the field-data entry screen are described in [Section 2.2.2](#) and [Tip Sheet 5.1](#), and can be displayed on the screen by typing "?".
- ❖ Additional parameters may be added during data entry without adding them to the field form by entering "%a" at any time.
- ❖ After the data entry is complete, the user is given an opportunity to make changes or enter a carriage return to continue. This carriage return completes data entry and a record number is generated. You may want to keep track of this record number on your field sheet or another location for future reference.
- ❖ After the record is stored, you must answer the query: ***Login another record (Y/N,<CR>=Y)?*** An "N" ends the program and a "Y" allows the user to login another sample.
- ❖ If a "Y" is entered, you must answer the query: ***Do you wish to edit the same header (Y/N,<CR>=Y)?*** The ability to edit the previous sample information allows for the rapid login of samples that contain similar information contained in the previous sample.

### 5.3 Tip Sheet: How do I design a field form...and why would I want to?

- ❖ Field forms allow the user to design a data input file containing the parameters that are routinely entered for a particular project, field trip, a local office water-quality field sheet, or data from a non-USGS laboratory.
- ❖ Creation of new field forms should be completed if the available field forms do not contain one that can be used for the needed purpose. This requires that the available field forms be reviewed prior to creating a new one.
- ❖ A field form is a file containing a list of parameter codes, method codes, parameter names or descriptions, analyzing entity codes, and identification that a parameter is mandatory for that form. Field forms are used in the Enter Field Results, program ([Section 3.2.1](#)), the Enter Laboratory Results program ([Section 3.2.2](#)) and in the Login Sample program ([Section 3.1](#)).
- ❖ Any editor that produces an ASCII output file can be used to create or edit a field form file.
- ❖ Any numeric parameter can be entered into a field form. Alpha parameters (such as GUNIT for geologic unit code) cannot be used in the field form.
- ❖ Up to 100 parameters can be included in a field form.
- ❖ Attach to the directory: `/usr/local/nwis/data/auxdata/qw_field_forms`
- ❖ **List the directory to see what field form numbers already exist before selecting a new 2-digit form number to create.**
- ❖ Initiate the editor from this directory and enter the data in the format shown below. Save the file as `field.parmsnn` where 'nn' is the new 2-digit number.
- ❖ The first line of the field form should be used to document the purpose of the field form by placing a "#" in the first column. Additional lines can be used for comments as long as a "#" is in the first column of the line. The format and an example of a field form are shown below.
- ❖ Use caution when creating descriptions for parameters to ensure that they are clear and match the definition in the PCD for that parameter. For example, if the parameter is defined as 'dissolved' in the PCD, then the description in the field form should contain 'dissolved' in the parameter description.
- ❖ Be sure that the final line of the field form contains a carriage return at the end. If this is not included, the last parameter will not be included to enter data.
- ❖ The field form must be space delimited. If any other delimiter is used an error will result when using the field form for data entry.

### Format of Field Form

|                      |                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Line 1</b>        | Begins with a "#" in column 1 and is used to describe the purpose of the field form, name of the person who designed the form, and date created. (This line is not required but is strongly recommended because the line is displayed if a list of field forms is requested.) |
| <b>Columns 1-5</b>   | Parameter code [5 digits, use leading zeros].                                                                                                                                                                                                                                 |
| <b>Column 6-10</b>   | Method code [optional] (5-character code)                                                                                                                                                                                                                                     |
| <b>Column 11</b>     | Not used.                                                                                                                                                                                                                                                                     |
| <b>Columns 12-36</b> | Parameter names or descriptions [could match local office water-quality field sheet]                                                                                                                                                                                          |
| <b>Column 40</b>     | Y indicates parameter is mandatory.                                                                                                                                                                                                                                           |
| <b>Column 42-49</b>  | Analyzing entity code (8-character code, See Appendix K for allowed entries)                                                                                                                                                                                                  |

### Example of Field Form

```
#NAWQA SW field form for Biological project was created
# by John Smith on 12-25-2009

99111      QA DATA TYPE          Y
```

## 5.4 Tip Sheet: How do I view my data in the database?

- ❖ Choose Option 3 – ‘Data Review’ from the main QWDATA menu and then select 4 - ‘List Samples and Results’. See [Section 3.3.4](#) for more details about this option.
- ❖ Identify the records you want to view by entering information from the screen or a file. The file format can be record numbers or sample key-fields: agency, station number, date, time (optional-see [Section 2](#)), and medium code. See [Section 3.3.1](#) for information about selecting sites and (or) samples.
- ❖ Choose to display the data to the screen, or output to a file.
- ❖ Two options are available to view the data:

- 1 -- short form**  
**2 -- long form**

If you have a small viewing area on your screen you will want to choose option 1. If you want to display the most complete set of information, you will want to choose option 2.

- ❖ Output from the two options:

### Short Form

```

## 5.5 Tip Sheet: How do I edit data that are already in the database?

Data that are already in the database can be edited in one of two ways. From the main QWDATA menu, choose **option 2 – Modify samples or results** or **option 8 – Batch Processing**. The *Batch Processing* option is recommended when large-scale or many small-scale changes to the database need to be made. The data are retrieved from the database in tab-delimited format. Changes are made to the batch files using the batch-file editor or an external text editor, and the corrected files are reprocessed using *Batch Processing* menu **options 1, 2, 3, or 4**. This process is described in more detail in [Tip Sheet 5.9](#).

This tip sheet describes the basic steps required to edit data that already exist in the database using **QWDATA main menu option 2**.

- ❖ The user must know the record number of the sample that is to be edited or the agency code, site number, begin date, begin time, end date (if there is one), end time (if there is one) and medium code before proceeding. **Note:** You must have write-access to the database.
- ❖ Choose **option 2 – Modify samples or results** from the main QWDATA menu.
- ❖ Choose **option 3 – Edit samples or results** from the *Modify samples or results* menu, and the following “qwedit” screen is displayed. **Note:** Before proceeding, confirm that the user is in the correct database.

- ❖ Enter the sample record number or press the <Enter> key and enter the agency code, site number, date(s), time(s), and medium code. The program will respond and ask you to confirm if this is the desired record.
- ❖ If this is not the correct sample record, enter an ‘n’ and the program will reset the input screen to the “qwedit” screen above. If it is the correct sample record, enter a ‘y’ and the program will display the following “Edit Options” screen:

**EDIT OPTIONS:**

- 1 – Select another record**
- 2 – Modify the record header**
- 3 – Modify the analytical data**
- 4 – Delete the record**

**Please enter your choice:**

- ❖ Choose **Edit option 1** to select another record.
- ❖ Choose **Edit option 2** to add, delete, or change any of the record header information. The sample header information is described in [Section 3.1](#). Choose Edit option 3 to add, delete, or change any of the analytical data or attributes associated with a result.
- ❖ For both **option 2 and 3**, the cursor control characters and options are shown at the bottom of the entry screen and are described in [Section 2.2.2](#) and in [Tip Sheet 5.1](#), and can be displayed on the screen by typing “?/”.
- ❖ Note that if the data have been reviewed, the DQI will have to be changed before making changes to an existing analytical result or its attributes.
- ❖ Choose **Edit option 4** to delete the entire record. The program will ask for confirmation that this record is to be deleted. To help ensure that no mistakes are made, the response must be “YES” in all capital letters.

**Please enter your choice: 4**

**Are you sure you want to DELETE that record (Must enter YES to delete)?**

- ❖ The program will confirm if the record has been deleted. If the record was not deleted, then the program returns the user to the “Edit Options” screen. If the record was successfully deleted, then the program returns the user to the initial “qwedit” screen.

## 5.6 Tip Sheet: How do I table data in publication-style table format?

This tip sheet describes the basic steps required to make a publication-style table. Publication-style tables include informative titles, column headings, and appropriate spacing for publishing tables of data. Links to sections in the documentation that contain details for certain topics are included. The user should refer to those sections for details that are not presented in this tip sheet.

- ❖ You must have a file of record numbers before beginning the tabling program. Create this file if you do not already have it. See [Section 3.3.1](#) or [Tip Sheet 5.15](#) for more information about retrieving records.
- ❖ From the main QWDATA menu, choose option 4 – *Data Output*.
- ❖ Choose option 3 – *Water-Quality Table by Sample (Publication Format)* from the Data Output menu. See [Section 3.4.3](#) for more details about this option.
- ❖ Enter the file name for the record-number file. Enter the file name for the output file.
- ❖ A table definition file is required. You may use an existing definition file or create one now. See [Section 3.4.3.2](#) for more information about table definitions.
- ❖ Provide parameter codes to be included in the table. This may be done interactively or by providing a file name for a file containing the parameter codes. See [Section 3.4.3.3](#) for more information about providing parameter codes and [Appendix G](#) for the format of a parameter code file.

**Choose table output options from the screen. See [Section 3.4.3.4](#) for detailed information on table output options. Following is the table options screen with the default options shown by X's:**

|                                     |                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| ( 1) Limit Results by DQI Code:     | <input checked="" type="checkbox"/> <b>X_Public accessible [ASR]</b> <input type="checkbox"/> User Specified           |
| ( 2) Parameter Order:               | <input checked="" type="checkbox"/> <b>X_Publication Order</b> <input type="checkbox"/> As Supplied                    |
| ( 3) Rounding of Result Values:     | <input type="checkbox"/> None <input type="checkbox"/> User <input checked="" type="checkbox"/> <b>X_Default</b>       |
| ( 4) Censoring of Zero Values:      | <input checked="" type="checkbox"/> <b>X_None</b> <input type="checkbox"/> User Specified                              |
| ( 5) Recensoring of Values:         | <input checked="" type="checkbox"/> <b>X_None</b> <input type="checkbox"/> User Specified                              |
| ( 6) Qualifiers in Output:          | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> <b>X_No</b>                                           |
| ( 7) Footnotes:                     | <input type="checkbox"/> None <input checked="" type="checkbox"/> <b>X_Remarks</b> <input type="checkbox"/> Qualifiers |
| ( 8) Create Parnames File:          | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> <b>X_No</b>                                           |
| ( 9) Time Datum:                    | <input checked="" type="checkbox"/> <b>X_Watch</b> <input type="checkbox"/> User Specified                             |
| (10) Restrict parameters:           | <input type="checkbox"/> None <input checked="" type="checkbox"/> <b>X_Public</b>                                      |
| (11) Display text for fixed values: | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> <b>X_No</b>                                           |
| (12) Calculated-value precedence:   | <input checked="" type="checkbox"/> <b>X_Stored, calculated</b> <input type="checkbox"/> User Specified                |

Enter item to change (1-12) or <CR> to continue:

**Note: A user with read-only access to the database will be able to table results with data quality indicator (DQI) codes of A – historical, S – presumed satisfactory, or R – reviewed and accepted. A user must have write access to table results for DQI codes of Q – reviewed and rejected, I – awaiting review, U – unapproved method or lab., or P, O, or X – proprietary results.**

- ❖ After the table is retrieved, you can create another table with the by-sample format by entering a ‘Y’ at the next prompt and the tabling program will begin again. If another table is not required, type ‘N’ at the prompt.
- ❖ The output file contains “Fortran carriage control” characters. Use the Unix command:  
`asa <filename> | lp -y landscape -d<printer name>`  
to print the formatted file. Fortran carriage-control characters are numeric codes written in the first column of each line describing how the printout should appear. If the command ‘`-d<printer name>`’ is not appended, the destination will be your default printer. For more details, see manual page (“man lp”).

## 5.7 Tip Sheet: How do I make flat files to use data in programs outside of QWDATA?

This tip sheet describes the basic steps required to make a flat file using column-style (by-sample) output. If you would like to make a flat file using row-style (by-result) output, refer to [Section 3.4.6](#). Flat files do not include titles or column headings, but are simple columns of data. This type of output is typically used for simple data reviews or to enter data into other software. Links to sections in the documentation that contain details for certain topics are included in this tip sheet. The user should refer to those sections for details that are not presented in this tip sheet.

- ❖ You must have a file of record numbers before beginning the tabling program. Create this file if you do not already have it. See [Section 3.3.1](#) or [Tip Sheet 5.15](#) for more information about retrieving records.
- ❖ Choose option 4 – *Data Output* from the main QWDATA menu.
- ❖ Choose option 5 – *Flat File by Sample* from the Data Output menu.
- ❖ Six options are available to create a flat file using by-sample output:

```
qwtable -- Flat file (by sample)

You have 6 options for flatfile output:
 1 -- Fixed column flat file (qwflatout)
 2 -- Flat file with TAB delimiter (RDB format)
 3 -- Flat file with user-specified delimiter
(Following options include method code in output)
 4 -- Fixed column flat file (qwflatoutm)
 5 -- Flat file with TAB delimiter (RDB format)
 6 -- Flat file with user-specified delimiter

Enter option desired (1-6, <CR>=1):
```

- ✓ Option 1 produces two files: one with the data in fixed columns separated by spaces and the other containing a list of parameter names. This option can be used to import the data to other programs; however, delimited files are better for some programs (see option 3).
- ✓ Option 2 produces a tab-delimited RDB file with header lines at the top of the file containing parameter and format information followed by the data. Only those users wishing to use the RDB capabilities should choose this option.

- ✓ Option 3 produces two files: one with the data delimited by the user-defined delimiter and the other containing a list of parameter names. This option can be used to import the data to other programs.
- ✓ Options 4-6 are similar to options 1-3, but the output also includes method codes when method codes exist with a result. This option creates an extra spaces or column for each parameter specified in the parameter list to hold a method code; in some cases this column may be blank because no method code exists.

\* See [Section 3.4.5](#) for more details about these options.\*

- ❖ Each option has the following prompts:

- ✓ Options 1 and 4:

**Enter name of file containing record numbers (Q to quit):  
Enter name of file to hold output –**

- ✓ Options 2 and 5:

**Do you want remarks and values to be delimited (Y/N,<CR>=Y)?  
Enter name of file containing record numbers (Q to quit):  
Enter name of file to hold output –**

- ✓ Options 3 and 6:

**Enter column separator char or TAB for tab char:  
Do you want remarks and values to be delimited (Y/N,<CR>=Y)?  
Enter name of file containing record numbers (Q to quit):  
Enter name of file to hold output –**

- ✓ Options 2, 3, 5, or 6 allow you to separate remarks, such as < or E, into a different column from the values by answering 'Y' to that prompt. For options 3 and 6, any character may be used as a column separator, but the most common are tabs, commas, and slashes.
  - ❖ Provide parameter codes to be tabled. This may be done interactively or by providing a file name for a file containing the parameter codes. See [Section 3.4.3.3](#) for more information about providing parameter codes and [Appendix G](#) for the format of a parameter code file.
  - ❖ Choose table output options from the screen 'qwtable -- current selections for options'. See [Section 3.4.3.4](#) for detailed information on table output options. Following is the table options screen, X's indicate the default settings:

```
qwtable -- current selections for options

( 1) Limit results by DQI Codes:      X_Public accessible [ASR]   __User Specified
( 2) Parameter Order:                 X_Publication Order   __As Supplied
( 3) Rounding of Result Values:     __None   __User  X_Default
( 4) Censoring of Zero Values:       X_None   __User Specified
( 5) Recensoring of Values:         X_None   __User Specified
( 6) Create Parnames File:          __Yes  X_No
( 7) Time Datum:                  X_Watch   __User Specified
( 8) Restrict parameters:          __None  X_Public
( 9) Display text for fixed values: __Yes  X_No
(10) Calculated-value precedence:    X_Stored, calculated __User Specified

Enter item to change (1-10) or <CR> to continue:
```

**Note:** A user with read-only access to the database will be able to retrieve results with data quality indicator (DQI) codes of A – historical, S – presumed satisfactory, or R – reviewed and accepted. A user must have write access to retrieve results for DQI codes of Q – reviewed and rejected, I – in-review, U – unapproved method or laboratory, or P,O, or X – proprietary results.

- ❖ After the file is retrieved, you can create another flat file with the same format by entering a ‘Y’ at the next prompt and the tabling program will begin again. If another table is not required, type ‘N’ at the prompt.

## 5.8 Tip Sheet: How can I find a parameter code number or name?

- Several options for parameter code number or name queries are available on the [Support Files \(Section 3.6\)](#) menu option 6 of QWDATA.
- Option 2 on the [Support Files](#) menu gives you the option to retrieve parameter code information by parameter code or parameter name. Output is to the screen only:

qwpcdpeek

Only parameters that are displayed to the public  
and can be entered into NWIS are retrieved by this program

Do you want to identify parameters by:

1. code
2. name

Please enter option (1,2,q):

Choosing option 1 results in the following system prompt:

Do you want to enter parameters from the terminal? (y,n, <CR>=y):

Choosing entry from the terminal results in the next prompt:

Enter parameter codes (<CR> to quit)  
(To retrieve a range, enter PCODE-PCODE; <PCODE; >PCODE; <=PCODE; >=PCODE)

1:

Enter a 5-digit parameter code, a range of codes with a hyphen in the middle, or use the greater-than or less-than operators. Search results will be shown on the screen and include the parameter number(s) and name(s).

If you answered ‘n’ to the previous prompt to enter parameters at the terminal, the next prompt will look like this:

Enter the pathname of the  
input file (q to quit): \_testfile

The program requires a simple text-file formatted with integers in the first 5 columns, followed by a carriage return or a space. It does not read anything after the space to the right. It will also accept a range of parameters separated by a hyphen, or using the ‘=’, ‘<’, ‘>’. An example file:

```
# example file 'testfile'  
00631  
00670-00685  
80155 sediment discharge  
99100-99199  
>=99600 silly text  
<00090  
<=00100
```

Choosing option 2 results in the following system prompt:

```
Do you want to enter parameter names from the terminal? (y,n,q, <CR>=y): _
```

Choosing entry from the terminal results in the next prompt:

```
Enter parameter names (<CR> to quit)
```

```
1: _nitro_____  
2: _____
```

At this point, you may enter a parameter name, partial name, or string of letters. All parameter codes and names that contain the character string anywhere in the parameter long name will be displayed to the terminal.

If you answered ‘n’ to the prompt to enter parameter names at the terminal, the next prompt will look like this:

```
Enter the pathname of the  
input file (q to quit): _____
```

The input file should have a format as described above for terminal entry. Place separate name searches on their own line in the text file.

- Option 3 on the [Support Files](#) menu gives you an advanced search function, and only writes output to a file. It is described in the User Documentation in [Section 3.6.3](#).

## 5.9 Tip Sheet: How do I load data using batch processing?

- ❖ Batch processing is used for loading electronic data files, generally from laboratories and including non-USGS laboratories, into the database.
- ❖ Files typically named ***qwsample*** and ***qwresult*** are used by QWDATA to load data via batch processing.
- ❖ Descriptions of the batch file formats are in [Appendix F](#). A document that describes the requirements for external laboratories that may want to produce the batch format is located at (Internal USGS users only) [http://phoenix.cr.usgs.gov/www/lab\\_coord.html](http://phoenix.cr.usgs.gov/www/lab_coord.html).
- ❖ To begin batch processing, choose option 8 – *Batch Processing* from the main menu. See [Section 3.8](#) for more details about this option.
- ❖ The Water-Quality Data Transfer System (Qwdx) is used by the NWQL and other USGS laboratories to transmit data to their customers. You should first retrieve the ***qwsample*** and ***qwresult*** batch files from the Qwdx system. The retrieval can be done using an automated or manual process.
- ❖ The program will look for the ***qwsample*** and ***qwresult*** batch files in the directory where the program is initiated.
- ❖ The batch process can be run in one of three ways:
  1. The batch process updates sample records that are already in the database (option 1 – *Enter batch-file data for logged-in samples*). The data are matched based on agency code, site ID, begin date and time, end date and time, and medium code which are contained in the sample-level file (***qwsample***). The result-level data (***qwresult***) are appended to the existing sample.
  2. The batch process enters and updates samples in the database (option 2 – *Enter batch-file data for all samples*). The data are matched based on agency code, site ID, begin date and time, end date and time, and medium code, which are contained in the sample-level file (***qwsample***). If a match is found, the result-level data (***qwresult***) are appended to the existing sample. If a match is not found, a new sample is created and the result-level data are processed.
  3. The batch process provides an interactive, screen-oriented, batch-precursor program for the expert user to set batch modes (option 4 – *Enter batch-file data with user-specified behavior*). The filename, the transactions allowed, whether or not the results are protected by DQI codes, the type of data that can be updated (lab only or lab + field), and whether or not an ionic balance is prepared are behavior modes that can be selected by the user. Four types of transactions are allowed:
    - Only updates to samples. This is the same mode as when the Batch Processing, option 1, *Enter batch-file data for logged-in samples* option is selected.
    - Only addition of new samples. This is the mode used for the addition of new samples to the database. This option cannot be used for updating existing samples.

- Any transaction. This is the same mode as when the Batch Processing, option 2, *Enter batch-file data for all samples* option is selected.
- Verification only, no transactions stored. This capability provides for a “dry run” of the batch program. This mode can be useful for checking data from an external source or for cleaning up data prior to an attempt at storage in the database. The sample record number is reported as “Unstored” on the WATLIST when this mode is used. Rejected sample and result files are created in verification mode, but these files contain only those records that would have been rejected if the user had attempted to store the data.
- ❖ Environmental and quality-control (QC) data are directed to an appropriate database based on the sample medium code. [Appendix A](#) describes medium codes and identifies which are environmental or QC media. Each user is linked with a pair of environmental and QC database numbers. The linkage can be changed using option 7 – *Utilities* from the main menu, submenu option 1 – *Change Database Number*. If no linkage has been established for the userid, then databases 01 and 02 are used for the environmental and QC samples.
- ❖ A record of the actions taken when a batch file is processed is written to a file named *watlist.yyyymmdd.hhmmss*. The first page of this file identifies the options used during the batch processing and the file names processed. The subsequent pages present each of the samples processed, sorted by project number.
- ❖ Each result row printed in the *watlist* is preceded by a one-letter transaction code.

| Transaction code | Explanation                                     |
|------------------|-------------------------------------------------|
| N                | New stored result from the batch                |
| U                | Updated result from the batch                   |
| P                | Previously stored result prior to the batch     |
| D                | Deleted result stored prior to the batch        |
| X                | Present in the batch, but ignored due to errors |
| C                | Calculated, not stored                          |
| ‘blank’          | Previously stored and unchanged by the batch    |

- ❖ The *watlist* also contain a cation/anion balance and messages from validation checks. The *watlist* should be reviewed for chemical accuracy and preserved for the required length of time per Federal Records Disposition Schedule as part of the official record for the sample, as it is considered original data.
- ❖ Data for samples that are not successfully processed with the batch program are output to files for clean up (*rejected.sample.yyyymmdd.hhmmss* and *rejected.result.yyyymmdd.hhmmss*).
- ❖ Samples that are not successfully processed have one or more of the following problems:
  - invalid formats (columns have been shifted, etc),
  - invalid site IDs, dates, times, or medium codes,
  - results for samples that do not already exist in the water-quality file (except for menu options 2 and 4),

- (d) samples that contain results that are overwrite-protected with a DQI value (except menu options 3 and 4), and
  - (e) an incorrect transaction type is selected from menu option 4.
- ❖ There is a batch-file editor available through the batch menu, option 6 – *Edit tab-delimited batch files*, for fixing errors in files that are in the tab-delimited format. A text editor can also be used to edit the tab-delimited files, but the user should be extremely careful not to delete or add tabs used to separate the columns of data.
  - ❖ To help verify the format of tab-delimited files, the program ***qwcat*** can be used. For more information about this program refer to [Section 3.9](#).
  - ❖ After the necessary steps are taken to correct any problems, the corrected samples can be entered by renaming the files to the appropriate batch filename (***qwsample*** and ***qwresult***) and initiating one of the batch input programs (options 1, or 2). If option 4 is selected, the files do not need to be renamed.
  - ❖ If data are rejected during the batch loading because of DQI protection but you have reviewed the new data and accepted it, you can reload the data from the batch file and override the DQI protection using option 3 – *Reload batch-file data, overriding DQI*, assuming you are certain that you should overwrite the previously reviewed results.

## 5.10 Tip Sheet: How can I use SQL to retrieve data from the database?

- ❖ The Structured Query Language (SQL) provides a method for retrieving data from a relational database, such as NWIS.
- ❖ There are several different ways to query a database using SQL. This tip sheet focuses on the UNIX “tsql” command. Other mechanisms include packages such as MS-Access and ESRI-ArcInfo. Using “sqlplus” is another example. Each mechanism employs a different user interface and may have a somewhat different syntax.
- ❖ A valid “tsql” command consists of several phrases.

**tsql *database\_name [options]* “*SQL\_statement*”**

|                               |                                                                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tsql</b>                   | Every tsql statement begins with this phrase.                                                                                                                                                  |
| <b><i>database_name</i></b>   | Usually the characters “nwis” followed by a two-character state suffix. The name of the NWIS database on the local computer can be displayed with the UNIX command cat /usr/opt/nwis/.nwisdbs. |
| <b><i>[options]</i></b>       | Optional arguments to control the behavior of “tsql.” The most commonly used option is “-rdb” to produce a RDB output. Use “man tsql” for other options.                                       |
| <b>“<i>SQL_statement</i>”</b> | An SQL query enclosed in double-quotation marks.                                                                                                                                               |

- ❖ The output of a “tsql” query is often redirected to a file, or piped to another command for subsequent processing, using the UNIX-shell operators “>” or “|”.
- ❖ Composition of the SQL statement consists of three main specifications:
  1. A list of the columns to output,
  2. The name of the database table(s) containing those columns, and
  3. An optional restriction clause that limits which rows of data are retrieved.

- ❖ The syntax for stating these specifications looks like:

**“select *column-list* from *table-name(s)* where *restriction-clause*”**

- ❖ The column and the database table names can be determined from inspection of the database design documents.
- ❖ Here is an example query that retrieves a list of record numbers and parameter codes from database 01 where the ‘V’ remark code has been stored:

**tsql nwishq “select record\_no, parm\_cd from QW\_RESULT\_01 where remark\_cd = ‘V’”**

Note the two-column names are separated with a comma, the literal V-remark code is within single-quotation marks, and the entire SQL statement is surrounded by double-quotation marks. To save the results of this query into a file named “my\_v\_samples.txt”, append the following to the command: “>my\_v\_samples.txt”.

- This query employs the SQL keyword “distinct” to limit the output to unique record numbers where any results have a DQI code of ‘A’. Thus, duplicated record numbers are omitted for those samples where more than one result satisfies the query.

**“select distinct record\_no from QW\_RESULT\_01 where dqi\_cd = ‘A’”**

- More than one table can be queried in the same SQL statement. When querying more than one table, each column name is annotated with a shorthand reference to the corresponding table, and you must identify (in the where clause) how the tables are linked or joined. Identically named columns in the two tables usually are linked. See below how the column record\_no is joined from each table. For example:

```
“select a.agency_cd, a.site_no, a.hyd_cond_cd, b.remark_cd, b.result_va, parm_cd from QW_SAMPLE_01 a,  
QW_RESULT_01 b where a.hyd_cond_cd in (‘5’,‘6’,‘7’,‘8’) and a.record_no = b.record_no and b.parm_cd =  
‘00061’”
```

The two tables have been assigned the arbitrary shorthand names of “a” and “b” in the “from” clause, and this shorthand has been used as column-name prefixes in the column-name list, as well as the “where” clause. The shorthand prefix “a” identifies columns in the table QW\_SAMPLE\_01 and the shorthand prefix “b” identifies columns in the table QW\_RESULT\_01.

The linkage between the two tables is specified by the phrase: “**and a.record\_no = b.record\_no**”. An omitted or incorrect linkage phrase typically causes voluminously useless results and very slow query response time.

This example investigates stations and instantaneous discharges (parameter code 00061) where the hydrologic condition is “falling stage”, “stable high stage”, “peak stage”, or “rising stage”.

- The “where” clause may contain column names, comparison operators, literals, and logical operators. Previous examples have demonstrated some of the syntax. Literal text variables are quoted; literal numeric variables are not quoted. The table below presents some additional operators that can be used in a “where” clause.

| Operator | Type of operator | Explanation                                                                    |
|----------|------------------|--------------------------------------------------------------------------------|
| =        | comparison       | equal to                                                                       |
| !=       | comparison       | not equal to                                                                   |
| >=       | comparison       | greater than or equal to<br>(comparison differs for numeric or text variables) |
| <=       | comparison       | less than or equal to                                                          |
| >        | comparison       | greater than                                                                   |
| <        | comparison       | less than                                                                      |
| in       | comparison       | Value in list. The list is comma-delimited and contained within parenthesis.   |

| Operator | Type of operator | Explanation                                                                                                                           |
|----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| is null  | comparison       | Value is not stored. (No predicate is used.)                                                                                          |
| like     | text comparison  | Matches part of text. The metacharacter ‘%’ matches any number of characters, and the metacharacter ‘_’ matches any single character. |
| not      | logical          | negation                                                                                                                              |
| and      | logical          | both are true                                                                                                                         |
| or       | logical          | either are true                                                                                                                       |

Here is an example query using some of the above operators.

```
"select a.record_no, b.parm_cd from QW_SAMPLE_01 a, QW_RESULT_01 b, QW_SAMPLE_CM_01 c where
b.null_val_qual_cd is not null and a.record_no = b.record_no and c.sample_cm_tx like '%meter%' and b.record_
_no = c.record_no"
```

This example retrieves the record number and parameter code for each result with a non-null null-value qualifier code and either field or laboratory sample comment contains the text “meter”.

- ❖ Date and time variables (column names ending in “\_dt”) in the NWIS water-quality subsystem are stored within the database in Universal Coordinated Time (UTC). When retrieved using tsql, the time zone will be UTC. The time-datum information coded with the sample record is not used during this conversion. Therefore, to obtain date-time information as entered into the database, use SQL to select the record numbers, and then retrieve the date-time information using the database software rather than using SQL.
- ❖ Blank strings versus NULL/empty strings: Null is not equal to a blank string in Oracle. If searching with *column=*”, Oracle will treat this as a null entry. If you have a clause that contains search criteria looking for blank strings, it will need to be written as *column=' '*.
- ❖ The information contained in this Tip Sheet is not a comprehensive SQL reference. Other references should be consulted for additional information.

## 5.11 Tip Sheet: How should sample type be coded for environmental and quality-control samples?

Sample Type is a required field to be stored with all samples. This tip sheet includes the recommended coding of sample type for environmental and quality-control (QC) samples. In addition, guidance is provided for storing selected parameter codes that are associated with certain sample types, which further describe QC samples. For complete descriptions of sample types, see Appendix A, table 4; however, some of these codes are now considered obsolete.

- ❖ The recommended sample type codes to use for your samples are shown in the following table. Although other codes exist in the QWDATA software and historical data, the codes shown in the table are the preferred sample types to use for storing new samples.

**Sample type codes**

| Code | Description                                                                             |
|------|-----------------------------------------------------------------------------------------|
| 9    | Regular (discrete), environmental sample.                                               |
| H    | Composite (through time), environmental sample.                                         |
| 7    | Replicate, environmental sample and the associated replicate quality-control sample(s). |
| 2    | Blank, quality-control sample.                                                          |
| 1    | Spike, quality-control sample.                                                          |
| 3    | Reference, quality-control sample.                                                      |
| B    | Other, quality-control sample.                                                          |

- ❖ For environmental samples that do not have an associated replicate QC sample, the coding is limited to two codes—9 (regular) and H (composite). For routine discrete samples, set sample type to 9 (regular). For samples that are composited through time and have both a begin date/time and an end date/time, set sample type to H (composite).
- ❖ For environmental samples that have associated replicate QC sample(s), code the environmental sample and QC sample(s) with sample type 7 (replicate). Storing sample type as 7 will help the user find replicate samples in both the environmental and QC database during retrieval.

- ❖ For the replicate sample type (7), fixed-value parameter 99105 (type of replicate) should be stored with the QC sample only to further describe that sample. For example, set 99105=10 if the replicate sample was collected with a concurrent sample collection procedure. (See Appendix B for all possible codes for any fixed-value parameter.)
- ❖ For blank sample types (sample type=2), the following fixed-value parameters should also be stored.
  - 99100 Type of blank solution (for example, 40=organic-free water)
  - 99101 Source of blank solution (for example, 10=NWQL)
  - 99102 Type of blank sample (for example, 100=field blank)

In addition to storing fixed values, ancillary information about primary blank water lot numbers can be numerically stored with the following parameter codes.

99200 Lot number, first, inorganic-grade water

99202 Lot number, first, organic-grade water

99204 Lot number, first, VOC-free water

Parameter codes 99201, 99203, and 99205 also can be used to store lot numbers.

- ❖ For spike sample types (sample type=1), the following fixed-value parameters should also be stored.
  - 99106 Type of spike (for example, 10=field spike)
  - 99107 Spike source (for example, 10=NWQL)

In addition to storing fixed values, other spike sample ancillary information can be numerically stored with the following parameter codes.

99108 Spike volume, milliliters (or use 91132 Spike volume, microliters)

99104 Reference material or spike lot number

Parameter codes 99150, 99151, 99152, 99153, and 99154 also can be used to store lot numbers.

Spike samples also need a result storing the sample volume appropriate for the spiked analytes of interest. The NWQL will normally provide a schedule-specific parameter, such as 99856; otherwise use 32002: Sample volume, milliliters.

- ❖ For reference sample types (sample type=3), the following fixed-value parameter should also be stored.
  - 99103 Source of reference material (for example, 100=chemical supplier)

In addition to storing the fixed value, ancillary information for the reference material primary lot number can be numerically stored with the following parameter code.

99104 Reference material or spike lot number

Parameter codes 99150, 99151, 99152, 99153, and 99154 also can be used to store lot numbers.

- ❖ Quality-control samples are often used to isolate the source of a previously identified problem or to determine if a change in data collection and processing has an effect on the results. These samples are “topical” QC samples and should be coded with sample type B and further described with explanatory sample comments.  
In addition, the following fixed-value parameter can be stored.  
99112 Purpose of topical quality-control data (for example, 100=topical QC for variability due to field equipment)
- ❖ Users can develop field forms (5.3 Tip Sheet) to use with QC samples to help insure consistent coding of these types of samples.

## 5.12 Tip Sheet: Why is there an “M” in my data?

The “M” is one of three possible remark codes that are associated with nonquantitative measurement results.

| Remark code | Explanation                                         | Detection status |
|-------------|-----------------------------------------------------|------------------|
| M           | Presence of material verified but not quantified    | Detected.        |
| N           | Presumptive evidence of presence of material        | Detected.        |
| U           | Material specifically analyzed for but not detected | Not detected.    |

An “M” remark code may be printed in output for various reasons, as explained below.

Some procedures are inherently nonquantitative, such as the “sniff test” for hydrogen sulfide. Results for nonquantitative methods are stored in the database using the above remark codes without corresponding values. Sometimes, however, a quantitative method produces a numeric result below the range of reliable precision; this causes the value to round to zero. A zero is misleading because it implies that the material is known to be absent (not detected). The NWIS software replaces most values that round to zero with an “M” remark code. (Some parameters such as temperature are allowed to round to zero.)

You can determine whether the data are rounding to zero and being replaced with “M” by retrieving the unrounded data (see *Tip sheet 5.19*) and parameter code, remark, value, and method. If no quantitative results are presented when data are retrieved unrounded, then the “M” remark was stored.

Alternatively, results that are rounded to zero and replaced with an “M” remark code indicate that the quantified result is outside the reliable range and has no reportable digits. The rounding algorithm typically depends on the precision specifications that are associated with each analytical method; therefore, verify that the analytical method is stored and that the method code is correct. You can look up method and precision information by using the option described in [Section 3.6.8 – Display the Parameter Method Table](#).

The precision specifications associated with a blank (*unknown*) method typically are crude and represent the reproduction of less modern methods. Storage of an appropriate method code may allow the result to round to a non-zero value. Similarly, storage of an inappropriate method code may also cause the rounding to be incorrect. In some cases, the method code stored with the result may be correct, but the rounding specification stored in NWIS may be incorrect. In these instances, you should work with the laboratory to determine if the rounding specification needs to be updated. If so, contact the Office of Water Quality to request that the method precision data be altered.

Some laboratories, including the National Water Quality Laboratory (NWQL), present raw results in their transmission to customers. Groups of raw results can be useful in statistical summaries and graphs, especially when analyzing quality-control samples; however, individual raw results should never be presented in USGS reports. Note that the NWQL’s sample-status Web page presents raw laboratory results.

## 5.13 Tip Sheet: How do I make large-scale updates to data?

There are several different ways of making large-scale updates to the database, including batch processing, UNIX scripts, and Standard Query Language (SQL). Recommendations on which technique to use and when to use that technique are described in this tip sheet.

### Batch Processing:

Batch processing can be used to change sample-level information or to add, change, or delete results for existing sample records.

- ❖ The NWIS software accepts “tab-delimited” formatted files. These files are typically called qwsample and qwresult. Description of the batch file format is in [Appendix F](#). Users are referred to [Tip Sheet 5.9](#) or [Section 3.8](#) for more details on batch processing.
- ❖ To create a batch file which can be used for making updates, option 7 – *Produce tab-delimited batch files* can be used from the Batch Processing menu.
- ❖ Large-scale updates should be made using option 4 from the batch processing menu so that any attribute in the tab-delimited formatted can be updated. See below for details.
- ❖ A remark code of ‘X’ will delete a result and all of the associated attributes.
- ❖ A geologic-unit code of “DELETE” will delete a sample and all associated result records.
- ❖ The batch process to use for updating laboratory data that are already in the database is option 1 – *Enter batch-file data for logged-in samples (qwcardsin)*.
- ❖ The batch process to use for entering new samples or updating laboratory data is option 2 – *Enter batch-file data for all samples (qwenter)*.
- ❖ The batch process to use for updating laboratory data that have DQI protection is option 3 – *Reload QW data from batch file, overriding DQI (qwcardsinxqli)*.
- ❖ Option 4 – *Enter batch-file data with user-specified behavior (user-specified modes)* allows the user to customize the batch processes by selecting:
  1. to enter a specific batch file name,
  2. one of four types of transactions (only updates to samples, only additions of new samples, any transaction, or verification only—no transactions stored),
  3. to over-ride update protection of reviewed results (DQI protection),
  4. to update only lab, or lab and field data,
  5. to print an ionic balance,
  6. to enable user-specified alert limits.
- ❖ A record of the actions completed during any batch process is written to a file named **watlist.yymmdd.hhmmss** for options 1, 2, and option 4.

- ❖ The parameter codes listed in the *watlist* are preceded by a one-letter code to indicate the type of transaction.
  - N New stored result from the batch
  - U Updated result from the batch
  - P Previously stored result prior to the batch
  - D Deleted result stored prior to the batch
  - X Present in the batch, but ignored due to errors
  - C Calculated, not stored
  - 'blank' Previously stored and unchanged by the batch

### **UNIX Scripts:**

UNIX scripts generally are used to capture queries that are frequently repeated.

- ❖ UNIX scripts require the responses to database prompts to be exactly what was planned for in the UNIX script. If an unexpected database prompt is encountered while a UNIX script is processing, the script will provide responses to database prompts that are incorrect and data could potentially be corrupted.
- ❖ UNIX scripts should only be used by experienced UNIX users and in situations where there is no potential for planned database prompts to deviate from actual database prompts.

### **SQL:**

SQL may be used for data retrievals by trained database personnel, but it is not recommended for any data updates. Reasons for this include: (1) date-time information are internally stored in UTC; (2) certain attributes have domain-list enforcement; (3) relational tables are linked with identifiers that could be corrupted and referential integrity broken; and (4) logical rules among inter-related fields (such as *rpt\_lev\_va* & *rpt\_lev\_tp*). See [Tip Sheet 5.10](#).

- ❖ If a situation arises where you need to change a large data set and batch processing or UNIX scripts will not work, please contact the NWIS office for assistance in evaluating whether SQL can be used to change data for your particular data scenario. If SQL is determined to be the only viable approach, NWIS staff would assist in developing an SQL script to update the data.

## 5.14 Tip Sheet: How do I use null values?

There are two situations where a null value is appropriate. The first situation is a null value that is the result of non-quantitative test indicating only the presence or absence of a constituent. The second situation is when an attempted measurement is not successfully completed due to logistical problems or unintentional errors, and a null value is stored in the data documenting the measurement attempt and the reason that no numerical result was stored. In general, most null values will be from laboratory analyses; however, null values can also be entered for field values.

There are two ways that a null value can be entered into QWDATA

### ➤ Interactive

- Details about how to enter data interactively in QWDATA is available in [Section 3.2](#).
- A null value is entered in the database interactively by entering a ‘#’ character in the value field in the field form, the laboratory-data entry form, or while editing existing data.
- After the ‘#’ is entered, the user is required to qualify the null value with either a “null value remark” or a “null value qualifier”, as described by the screen prompts:

You have specified a NULL result value. You must qualify null values with a null value remark code or a null value qualifier code.

#### Null Value Remarks:

**M:**Presence verified but not quantified  
**N:**Presumptive evidence of presence.  
**U:**Analyzed for but not detected.

#### Null Value Qualifiers:

**a:**Planned measurement was not made  
**b:**Sample broken/spilled in shipment  
**c:**Sample lost in lab  
**e:**Required equipment not functional/avail  
**f:**Sample discarded: improper filter  
**i:**Required sample type not received  
**l:**Analysis discarded: lab QC failure  
**m:**Results sent by separate memo  
**n:**Non-performing compound, reasons unknown  
**o:**Insufficient amount of water  
**p:**Sample discarded: improper preservation  
**q:**Sample discarded: holding time exceeded  
**r:**Sample ruined in preparation  
**u:**Unable to determine-matrix interference  
**w:**Sample discarded: warm when received  
**x:**Result failed quality assurance review

**Enter a remark code (R) or a qualifier code (Q)?**

- After entering ‘R’ or ‘Q’, choose the remark or qualifier for the null result.

➤ **Batch**

- A null value can be entered in using batch files if the value is blank and a valid null-qualifier or remark code is present for the result record in the tab-delimited “qwresult” file. Batch processing is discussed in [Section 3.8](#).

## 5.15 Tip Sheet: How do I retrieve records for use in other QWDATA programs?

Programs used to view data in the QW database (data review, data output, and graphics programs) either require or will accept a file of record numbers. Additional information about record numbers can be found in [Section 2.1.5](#). This tip sheet describes how to create a file of record numbers from a single database. Site or record retrieval from multiple databases can be done using similar steps; the user is prompted for the information for each database specified. [Section 3.3.2](#) provides details about retrieving data from multiple databases.

- ❖ Selecting sites or samples from a single database may be accomplished from two options in the QWDATA main menu: option 3 – *Data Review* or option 4 – *Data Output*. From either of those menus, choose option 1 – *Select Sites or Samples*.
- ❖ Three options are available for retrieving water-quality records from specific sites and one option is for retrieving water-quality information for any sites. See [Section 3.3.1.1](#) for detailed information.

```
qwsiterec -- locate record numbers for use by QW application programs  
QW database(s): 01
```

You may locate records for specific sites.

If you wish to locate records for specific sites the options are:

- 1 -- You have a file containing site numbers
- 2 -- You will enter site numbers at terminal
- 3 -- You wish to locate sites based upon selection criteria

If you don't care which sites the option is:

- 4 -- Locate QW records without regard to site

Please enter option (1-4,Q to quit):

- ❖ If sites are retrieved, the option is given to sort the sites after retrieval. The retrieved sites may be sorted on a variety of fields that will be displayed by the program.
- ❖ If the retrieved sites will be used in the future, save them to a file.
- ❖ Regardless of the option chosen, you will be given the opportunity to refine the water-quality records retrieved using the following menu:

Locate QW records

Enter an X to choose an item for limiting retrieval,  
Enter a # to remove an item.

(1) DATE: \_ (2) MEDIUM CODE: \_ (3) ANALYSIS-LEVEL CODES: \_  
(4) PROJECT ID: \_ (5) GEOLOGIC UNIT: \_ (6) PARAMETER VALUES AND CODES: \_  
(7) PARAMETER GROUPS: \_ (8) DATA QUALITY INDICATOR CODES: \_

- ❖ See [Section 3.3.1.2](#) for detailed information about the menu shown above.
- ❖ Select “ANALYSIS-LEVEL CODES” to retrieve proprietary and (or) internal-use data. See [Section 2.14](#) for definitions.
- ❖ You will be given another opportunity to save sites that contain the requested water-quality information to a file. This group of sites may be a subset of the sites retrieved using option 1 or 2 in the first menu shown above.
- ❖ The records retrieved can be sorted on a variety of fields (See [Section 3.3.1.2](#) for more detailed information):

**qwsiterec -- Total number QW records located: 12227**

**Do you wish to sort the located QW records (Y/N)? Y**

**You may sort on any combination of the following fields:**

|                      |                         |
|----------------------|-------------------------|
| A -- Agency code     | F -- Geologic unit code |
| B -- Station number  | G -- County code        |
| C -- Dates and times | H -- Station name       |
| D -- Medium code     | I -- Station type       |
| E -- Project ID      |                         |

**The first field will be the primary sort**

**the next will be the secondary sort 1, ...**

**Please enter the sort codes on one line with no embedded spaces**

**Enter sort code(s):**

- ❖ Provide a file name for the file to hold the water-quality records.
- ❖ The resulting file of record numbers can be used in QWDATA programs that accept files of record numbers. Use clear, descriptive filenames if these record numbers will be used again.

## 5.16 Tip Sheet: How do I enter reports into the problem-reporting system?

If you run across a problem while using NWIS or have questions about NWIS user documentation, reference lists or have ideas about enhancements, the problem-reporting system—GNATS—can be used to notify NWIS personnel. To access the GNATS system (internal USGS users only): [http://nwis.usgs.gov/cgi-bin/gnats\\_home.pl](http://nwis.usgs.gov/cgi-bin/gnats_home.pl).

The next screen should allow you to login using your Unix ID.

The main menu for GNATS will include options to create, edit, view, query, log out, and get help:

### FOR NWIS USE ONLY

|                                          |                         |                       |
|------------------------------------------|-------------------------|-----------------------|
| <b>default</b> User: yourID Access: edit |                         | <b>NWIS Gnatsweb</b>  |

### Create a New Problem Report

- ❖ Before you enter a new problem report for the problem you have identified, please do the following:
  - Attempt to recreate the problem two more times. By producing the behavior three times, you insure it is a ‘bug’ that can be recreated by following specific steps.

- Check the NWIS "Known Problems" page to see if a workaround to your problem is available (internal USGS users only):  
[http://nwis.usgs.gov/IT/NWIS5\\_0/known\\_problems\\_nwis.html](http://nwis.usgs.gov/IT/NWIS5_0/known_problems_nwis.html) .

- ❖ To create a new problem report, click the  button from the main page.
- ❖ The Create Problem Report Screen contains several mandatory fields which contain an asterisk and are marked in red:

### Create Problem Report

| <input type="button" value="submit"/> or                      |  |

Notice that the “PR Creator’s email ID” field will be automatically populated with your user ID.

- ❖ If there are others that might want to know about the progress of a solution to your problem, put their email IDs in the “Notify-List” box, separated by spaces. When information is added to the problem report, the PR Creator and those on the Notify-List will receive an email containing that information so that you know work is being completed on your problem.
- ❖ Choose the radio button for the “Category Type” that best represents where your problem occurred. The radio button chosen will limit the list of options in the category window. Click on the specific category from the window. If you know the name of the category, type it in the box, prefix first.
- ❖ The “Synopsis” should include enough of a description that someone would be able to determine the situation that caused the problem or created the question or enhancement. Consider using 10 words or less.
- ❖ Indicate the “Severity” by selecting from the drop-down list. Consider the extent to which your problem is hampering your work. A critical problem is one in which the programs stop working completely or data are incorrectly stored or displayed. A serious problem is one in which your workflow is seriously hampered. A non-critical problem is a question, an enhancement, or a problem that is annoying, but doesn’t significantly affect your workflow.

- ❖ Indicate the “Class” of the problem by selecting from the drop-down list:
  - Software-bug – Problem requiring a correction to software
  - Software-enhancement – Suggested change in functionality
  - Support – Support problem or question
  - Documentation – Correction or improvement in documentation
  - Reference-list – Request for a change to a reference list
  - Duplicate – Duplicate of another existing PR
  - Mistaken – Accidental PR submission

When you enter a new report you will likely use one of the first five choices.

- ❖ To determine the entries for release and environment, type nwisenv at your UNIX prompt. The release information is near the top of the resultant list in the form and will appear similar to: **nwis-5.0.1-4**. Choose the appropriate release from the “Release” pull down menu. Copy everything after **User Environment**: into the “Environment” text box.
- ❖ In the “Description” text box, enter a detailed description of your problem. This is your space to provide details to help NWIS personnel understand your problem. Please include results that illustrate the problem or how the problem is hampering your work. NWIS personnel will use this information to determine the severity of the problem as well as possible short-term and long-term solutions.
- ❖ If you have attachments that help illustrate the problem or provide information necessary to reproduce and troubleshoot the problem, provide the pathname in the “File Attachments” box. As an alternative, use the browse button to find the attachment on your machine, select it, and click open to place the pathname in the “File Attachments” box. ***Note: The GNATS web interface will only allow the addition of one attachment at a time. If you have multiple attachments to associate with a particular problem report, you will have to edit the PR each time you want to add another attachment.***
- ❖ The “Project Name” text box is generally reserved for NWIS and User Group’s use. This field allows PR’s to be associated together to provide a quick way of determining problems associated with a specific project release. There are projects that may cross multiple Categories, and usage of a consistent text-string will allow for grouping and retrieval of problem reports.
- ❖ In the “How to Repeat” text box, enter a step-by-step description you used to cause the problem to occur. You should include a list of the menu options used and a description of the files you used, if applicable. This set of instructions is critical for NWIS personnel to duplicate the problem on a test system.
- ❖ The “Fix” box will be completed by NWIS personnel or others when a fix or workaround information is available to resolve the issue.
- ❖ As a last step, click on the Submit button at the top or bottom of the page. You should get a message back that you will receive an email containing the problem report number and some information that you entered. You should also be returned to your previous page quickly, but if needed, click on your web browser “Back” button.

## Edit an Existing Problem Report

- ❖ To edit an existing problem report, enter the number of the PR you want to access and select the “edit” button from the main page.
- ❖ All of the same fields displayed in the “Create a new problem report” screen are displayed in the “Edit” screen as well as some additional fields:
  - **Priority:** This field will be used by NWIS personnel and User Group members to determine the importance of this PR relative to other PRs and tasks.
  - **Responsible:** This is the person responsible for completing work related to the initial problem.
  - **Reason Changed:** The responsible party or state of a PR will change as the problem is analyzed. There are two text boxes – one for why changes were made to the responsible party and one for why “changes to state” were made.
  - **Fix-Risk:** The choices in this field are available to NWIS personnel to identify the related risk to fix the initial problem.
  - **Fix-Difficulty:** The choices in this field are available to NWIS personnel to identify the difficulty of the fix for the initial problem.
  - **Release-Note:** The text in this box will be used to populate the NWIS release notes with information about this problem.
  - **Audit-Trail:** A list of the changes made to the report is found here.
  - **Unformatted:** This is an unformatted version of what appears in the Audit-Trail text box.
- ❖ When you receive notification that your PR has been changed, you might be asked to test the fix provided by NWIS personnel. The edit screen will allow you to make updates to the PR:
  - If the problem has been fixed, change the “State” from feedback to closed and enter information about how it was tested and/or why it was closed in the “Reason Changed” box.
  - If the problem has not been fixed, change the “State” to open and provide information about what is still wrong in the “Reason Changed” box.
  - If the state does not need to be changed, but you have additional information to add to the report, append your information to the end of the text in the “Description” text box or attach a file using the “File Attachments” box.
  - After you have made your edits, click on the submit button at the top or bottom of the page. If there were any errors on your edit page you will be notified. Click the “Back” button on your browser, fix the errors and submit again.
  - When all the necessary information has been provided, you should get a message that your edit was successful and you will be returned to the previous page. You should be returned to your previous page quickly, but if needed, click the “Back” button on your web browser.

## View an Existing Problem Report

- ❖ To view an existing problem report, enter the number for the PR you want to access and select the “view” button from the main page.
- ❖ All fields related to that PR will appear on the screen for you to view. If you decide to edit the same PR, click on the “edit” button at the top or bottom of the page.

## Query Existing Problem Reports

- ❖ To query the existing problem reports, click on the “query” or “advanced query” buttons from the main page.
- ❖ The “query” button will take you to a page where you can build a query based on information stored in the GNATS database.
- ❖ The output from this query can be customized by selecting the columns of interest from the “Column Display” list and by sorting the PRs in the list on any field chosen from the “Sort by” list.
- ❖ The “advanced query” button will take you to a page where you can build a query based on text that occurs in the PR or by the date-of-arrival, modification or deletion of a PR.
- ❖ Common regular expressions for use with PR queries:
  - To limit the PRs to a particular category type (ADAPS, QW, GW, WU, NWIS-RT, NWISWeb, etc.), in query or advanced query, use the following in the category box and substitute the abbreviation for the category type you are interested in, for example:

ADAPS-\*

- Category type abbreviations: ADAPS, QW, GW, WU, NWISWEB, Gen, RT, LRGS, DAR, NWISView, NFM, PCFF, HANDHELDs

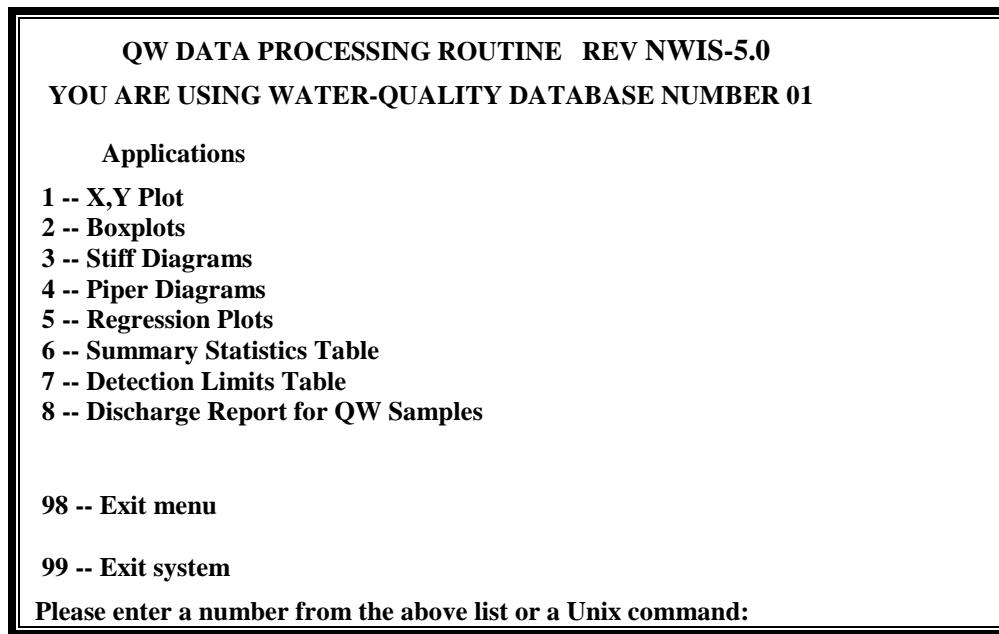

## Exiting the GNATS System

- ❖ When you are done using the GNATS system, select the “Log Out” button from any screen. This will return you to the login screen or close your browser.

## 5.17 Tip Sheet: How do I make linear plots of my data?

This tip sheet describes the basic steps to make X,Y (linear) plots of data using a program available within QWDATA. If you would like to retrieve data from QWDATA and use a graphics program available outside of QWDATA, please refer to [Tip Sheet 5.7](#). Links to sections in the documentation that contain details for certain topics are included. The user should refer to those sections for details that are not presented in this tip sheet.

- ❖ All graphics programs within QWDATA are available from option 5 – ‘Applications’ in the main QWDATA menu. Details for all the options in this menu are available in [Section 3.5](#) of the documentation. That option will display the following menu:

- ❖ Option 1 from the applications menu creates an X,Y plot in three stages: **(1)** retrieves data from the QW database that are written to an ASCII file, **(2)** uses data in the ASCII file to create the plot in a separate graphics (TKG2) window, and **(3)** from the TKG2 window, the plot can be printed or saved to a file.
  - The first query is a check of your Unix DISPLAY environment variable to check that it is set correctly. If you need help with this step, please contact your local system administrator. You are given the opportunity to stop the program at this point.
  - The next query is asking for a file of record numbers to identify what samples will be included in the plot. All graphical programs require an input file of record numbers to operate. The format of this file is one record number per line in columns 1-8 and can be generated through QWDATA ([see Section 3.3.1](#)) or created with an editor. Examples of this input file are shown in [Appendix G](#).
  - The next query asks for the name of the ASCII data output file. The program produces an output ASCII file that contains the data used in the plot; the file will be saved to the directory where you started QWDATA.

- The next query will give you the choice of the type of X,Y plot that will be produced. Three options exist for plotting the data: **(1)** 1-7 parameters by one parameter, **(2)** 1-7 parameters by sample date, and **(3)** Multiple stations by sample date for one parameter. All three options will handle data from multiple stations; however, only option **(3)** will identify the individual stations on the plot.
- Which type of plot you choose determines the next set of queries, but most queries are related to what parameters you want to include in the plot. Enter the parameter codes that you wish to include on the plot.
- After the program retrieves the data, a short set of summary information for the data retrieved is displayed to the screen for your review.
- The next prompt, List the Data?, allows you to display all the data to the screen. If you choose ‘Y’ then the data are displayed in a paired format. For example if option 1 was selected and parameter 00010 was chosen for the X-axis and parameters 00025, 00095, and 00915 were chosen for the Y-axis, the following data would be displayed:

```

P 00010 00025 00095 00915
T plot title in columns 3-42 (optional)
X Temperature, water
Y 1 Air pressure      0 POINTS
H 00010    00025    00010    00025    00010    00025
Y 2 Specific cond at 25C 2 POINTS
H 00010    00095    00010    00095    00010    00095
* 0.1500E+01 0.1600E+03 0.1400E+02 0.1150E+03
Y 3 Calcium, wf      3 POINTS
H 00010    00915    00010    00915    00010    00915
* 0.1500E+01 0.1900E+02 0.1400E+02 0.1500E+02 0.1500E+02 0.1300E+02
END OF DATA

```

- The next queries allow you to customize the plot title and axes labels.
- Finally, you have the option of connecting the plot points with lines.
- A separate TKG2 window should appear on your screen. From that window you can select the output format by selecting the ‘TKG2 Displayer’ button to see your output options.

The output options are printing the plot, saving the plot as a TKG2 control file, or export the plot into a Framemaker Interchange Format (mif), portable document format (pdf), portable network graphics (png), or postscript (ps) file.

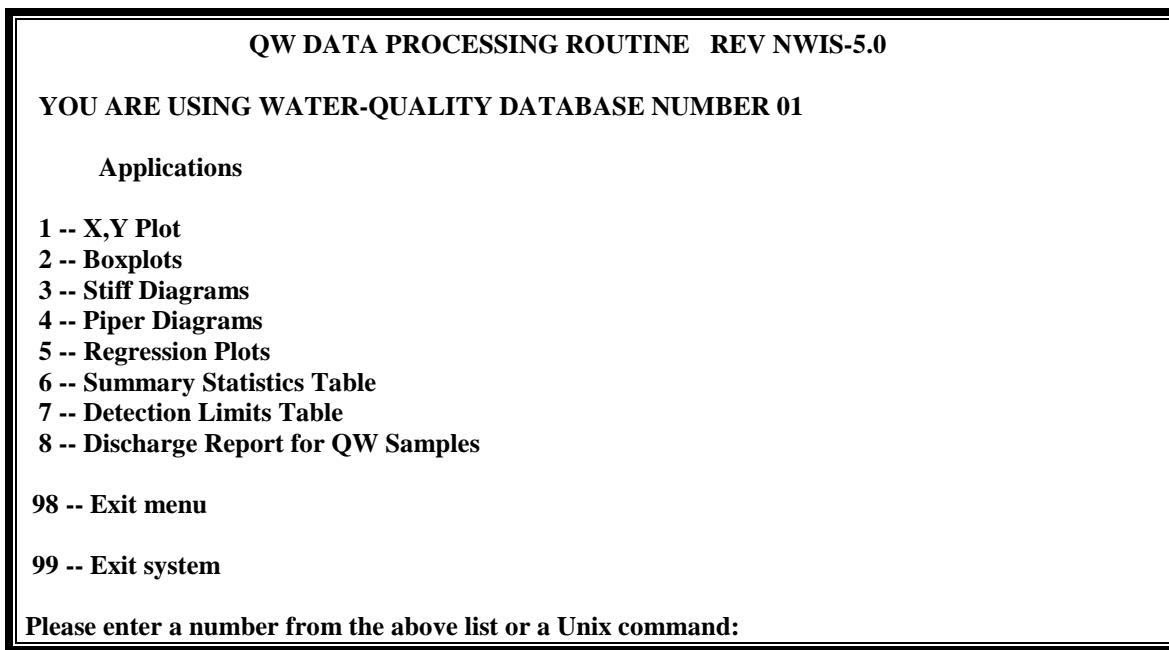

Any TKG2 or G2 files that are made can be manipulated outside of QWDATA by using TKG2. All files that are produced will be available in your working directory.

- When your output option is completed, you should use the ‘Exit’ option from the TKG2 Displayer window and then return to the Unix screen. Enter <CR> in that window and you will be returned to the applications menu.

## 5.18 Tip Sheet: How do I make boxplots of my data?

This tip sheet describes the basic steps to make boxplots of data using a program available within QWDATA. If you would like to retrieve data from QWDATA and use a graphics program available outside of QWDATA, please refer to [Tip Sheet 5.7](#). Links to sections in the documentation that contain details for certain topics are included. The user should refer to those sections for details that are not presented in this tip sheet.

- ❖ All graphics programs within QWDATA are available from option 5 – ‘Applications’ in the main QWDATA menu. Details for all the options in this menu are available in [Section 3.5](#) of the documentation. That option will show the following menu:

- ❖ Option 2 from the applications menu creates a boxplot in two stages: **(1)** retrieves data from the QW database that are written to an ASCII file and **(2)** uses data in the ASCII file to create the plot in a separate graphics (S-Plus) window and write the output to a file.
  - You should check that your UNIX DISPLAY environment variable is set correctly. If you need help with this step, please contact the local system administrator.
  - The first query is asking for the name of a file of record numbers to identify what samples will be included in the plot. All graphical programs require an input file of record numbers to operate. The format of this file is one record number per line in columns 1-8 and can be generated through QWDATA (see [Section 3.3.1](#)) or created with an editor. Examples of this input file are shown in [Appendix G](#).

- The next query asks for the name of the ASCII data output file. The ASCII files produced from S-Plus programs will be saved to the directory where you started QWDATA . Any other files that are produced while using this program (for example, PDF or Postscript) will be saved in a directory named NWIS\_Swork that is created in your home directory.
- The next query will allow you to select the type of boxplot for output from the following three options:

| Data-retrieval options                  | Code |
|-----------------------------------------|------|
| One station with one or more parameters | 1    |
| Multiple stations with one parameter    | 2    |
| Multiple stations treated as one        | 3    |
| Enter code for option, <cr> = 3 >       |      |

- Enter the desired parameter code(s) when prompted.
- After the data are retrieved, a table of summary information appears on the screen for your review:

```

RETRIEVING DATA ... RETRIEVAL COMPLETED

RETRIEVAL OPTION 2: PARAMETER CODE 00915 FOR 1 STATIONS

GROUPS RETRIEVED 1 MIN VALUE 13.000
GROUPS WITH DATA 1 MAX VALUE 19.000

SUMMARY OF VALUES BY GROUP:

GROUP      NUM OF      25TH      75TH
IDENTIFIER   VALUES  MINIMUM  PCTILE  MEDIAN  PCTILE
MAXIMUM

05016000    3*  13.000  14.000  15.000  17.000  19.000

LIST THE DATA? Ans: y / n, <cr> = n >

```

- If any censored values are found in the retrieved data, the next query will ask the user if these values should be estimated and what method should be used. More information about the two different methods is available in: *Statistical Methods in Water Resources* by D.R. Helsel and R.M. Hirsch.
- The next prompt, ‘List the Data?’, allows you to display all the data to the screen.
- The next prompt, ‘Plot the Data?’, asks if you want to plot the retrieved data. If you answer ‘y’ then you will choose between a schematic and a truncated boxplot for output. Details about each of these plots are available in [Section 3.5.2](#) of the user documentation.
- The next set of queries will allow you to customize the plot title and the axes labels.
- The next query will allow you to choose an S-Plus output option.

The output options are printing the plot to a separate x-window or a Tektronix window; or save the plot as a PDF, HP Laserjet, Encapsulated Postscript (EPS), or a Postscript file. For specific details on these output options, please refer to [Section 3.5](#). If option (1) is selected, a separate S-Plus window appears that includes the plot. To exit cleanly from this window, the user should include all responses in the UNIX window, not in the S-Plus window.

- The next query will allow you to use a different output option for the same plot.
- If you select 'n' and hit <CR> you will be returned to the main applications menu.

## 5.19 Tip Sheet: How can I round my results in QWDATA output?

- ❖ Rounding of values in table or flatfile output from QWDATA is controlled from the tabling options screen for the output format. The tabling options screen for publication format tables is shown below as an example:

|                                     |                                                                      |                                                      |
|-------------------------------------|----------------------------------------------------------------------|------------------------------------------------------|
| ( 1) Limit Results by DQI Code:     | <input checked="" type="checkbox"/> <b>X_Public accessible [ASR]</b> | <input type="checkbox"/> User Specified              |
| ( 2) Parameter Order:               | <input checked="" type="checkbox"/> <b>X_Publication Order</b>       | <input type="checkbox"/> As Supplied                 |
| ( 3) Rounding of Result Values:     | <input type="checkbox"/> None                                        | <input checked="" type="checkbox"/> <b>X_Default</b> |
| ( 4) Censoring of Zero Values:      | <input checked="" type="checkbox"/> <b>X_None</b>                    | <input type="checkbox"/> User Specified              |
| ( 5) Recensoring of Values:         | <input checked="" type="checkbox"/> <b>X_None</b>                    | <input type="checkbox"/> User Specified              |
| ( 6) Qualifiers in Output:          | <input type="checkbox"/> Yes                                         | <input checked="" type="checkbox"/> <b>X_No</b>      |
| ( 7) Footnotes:                     | <input type="checkbox"/> None                                        | <input checked="" type="checkbox"/> <b>X_Remarks</b> |
| ( 8) Create Parnames File:          | <input type="checkbox"/> Yes                                         | <input checked="" type="checkbox"/> <b>X_No</b>      |
| ( 9) Time Datum:                    | <input checked="" type="checkbox"/> <b>X_Watch Time</b>              | <input type="checkbox"/> User Specified              |
| (10) Restrict parameters:           | <input type="checkbox"/> None                                        | <input checked="" type="checkbox"/> <b>X_Public</b>  |
| (11) Display text for fixed values: | <input type="checkbox"/> Yes                                         | <input checked="" type="checkbox"/> <b>X_No</b>      |
| (12) Calculated-value precedence:   | <input checked="" type="checkbox"/> <b>X_Stored, calculated</b>      | <input type="checkbox"/> User Specified              |

- ❖ There are three different ways result values can be rounded upon output from QWDATA. Most of the output options use one rounding option for the entire table:

**Default      User      None**

**Note: The Office of Water Quality generally recommends that default rounding is used for publication of water-quality results from QWDATA, with specific other instructions for Radiological results (See Memos 2002.11 and 2008.06 at <http://water.usgs.gov/admin/memo/QW/>).**

- ❖ **Default rounding** allows the software to employ the use of either the **lab standard deviation** stored with the result value or the **rounding array** from the parameter-method table.
  - The **laboratory standard deviation** can be stored with each result and will be used to round the result value if it exists. This value is used with the ASTM E29-93a standard to determine the appropriate rounding for the result value. Details of this rounding application are available on the Phoenix web page dedicated to rounding. To retrieve the laboratory standard deviation, select a by-result output format and use the ALPHA parameter code of LSDEV.
  - If the laboratory standard deviation is not stored with the result value, the 10-element **rounding array** stored in the parameter-method table will be used. This rounding array contains ten elements: nine precision codes that apply to values within specific decadal ranges and one element for the maximum decimals (MaxDec) used to display any value. The nine precision codes have meanings as follows:

| Element | Applies to values with absolute magnitude:             | Meaning of precision code                                                                                                                                                                                                                                   |
|---------|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1       | less than 0.01 *                                       | Number of digits shown to the right of the decimal. (Eg. A raw number of 0.12345 rounded using a precision code of 3 is displayed as 0.123.)                                                                                                                |
| 2       | less than 0.1 and greater than or equal to 0.01        |                                                                                                                                                                                                                                                             |
| 3       | less than 1.0 and greater than or equal to 0.1         |                                                                                                                                                                                                                                                             |
| 4       | less than 10. and greater than or equal to 1.0         |                                                                                                                                                                                                                                                             |
| 5       | less than 100. and greater than or equal to 10         |                                                                                                                                                                                                                                                             |
| 6       | less than 1,000. and greater than or equal to 100      |                                                                                                                                                                                                                                                             |
| 7       | less than 10,000. and greater than or equal to 1,000   |                                                                                                                                                                                                                                                             |
| 8       | less than 100,000. and greater than or equal to 10,000 |                                                                                                                                                                                                                                                             |
| 9       | greater than or equal to 100,000                       | Number of significant digits shown.<br>Precisions 10 - 16 are signified by the symbols below:<br><br>10 - : (colon)<br>11 - ; (semi-colon)<br>12 - < (less than)<br>13 - = (equal)<br>14 - > (greater than)<br>15 - ? (question mark)<br>16 - @ (at symbol) |

\*Values equal to zero will be rounded using MaxDec, unless replaced by an "M" remark.

- ❖ **User rounding** allows the software to employ the use of a rounding code stored with a result. In some instances the default rounding behavior is not desired and user rounding will result in a rounded value that is controlled by the user-entered rounding code. The code stored is used in the same way as an element from the rounding array described above. If no code is stored with the result, the rounding array in the parameter-method table will be used.

**Note: Historically the stored user-rounding codes have been entered inconsistently and the use of this option may result in undesired output.**

- ❖ **No rounding** will result in the value being included in output in the same way it is stored in QWDATA.

**Note: Data output with no rounding may be useful for plots to avoid step patterns in the data.**

- ❖ The Publication Export output option allows the use of more than one rounding option in a table, by employing rounding on a parameter code basis if the user selects “custom” rounding (see [Appendix G](#) for input format).

Reminders about rounding in QWDATA output:

If an ‘M’ appears in place of a result in the output, the program has identified that the result will round to zero. If a zero is not allowed for that parameter, an ‘M’ is included. A separate flag in the parameter reference table indicates whether a zero is allowed for a specific parameter. Check [Appendix I](#) for a complete listing of parameters that are not allowed to have a zero result.

- Fixed-value parameters (e.g. sampling method, sampler type, purpose of site visit) will not be rounded.
- If the rounding of the results does not seem correct, please enter a GNATS report with the details of the output. Details on how to enter a GNATS report are included in [Tip Sheet 5.16](#).

Laboratories may supply a rounding code that is slightly different than those used in NWIS. Please contact the laboratory for details about the rounding codes used.

Note that NWQL uses a similar but not identical rounding array. The NWQL array has 7 elements corresponding to elements 1-7 of the NWIS array. NWQL elements 1-3, however, represent the number of significant digits to be shown. Thus a value to be displayed as 0.012 carries a precision code of 2 at NWQL and 3 in NWIS.

❖ Example of rounding from QWDATA:

| Unrounded Value | Precision Code | Rounded Result |
|-----------------|----------------|----------------|
| -0.123          | 1              | -0.1           |
| 1.5692          | 3              | 1.57           |
| 202.95          | 2              | 200            |

- ❖ Detailed discussions about rounding in QWDATA are available in the following sections of the QW User’s Documentation:
- [2.7.1 – Numeric Information – Rounding](#)
  - [3.4.3.4 – Water Quality Table Options – Rounding of Result Values](#)
  - [3.4.7.3 – Flat File with TAB Delimiter \(Publication Export\) – Specify Output Options](#)
  - [3.6.8 – Display the Parameter Method Table](#)

## 5.20 Tip Sheet: How do I change data quality-indicator codes?

Because the review status of a result changes through time, an application in QWDATA was designed to help users set data quality-indicator (DQI) codes. See [Section 3.7.6](#) for a complete description of this process. By default, data are entered into QWDATA with a DQI code of “S,” presumed satisfactory. After data are reviewed, their status is either “approved” or “rejected.” Water-quality data typically are reviewed and published annually as part of the [Annual Water Data Report](#). Therefore, DQI codes typically need to be changed on at least annually, although more regular updates of the review status are encouraged.

A DQI code will:

- indicate the review status of a result,
- affect whether the result will be included in the retrieval of output and displayed to the public via NWISWeb Interface,
- control the ability of the batch software to overwrite a value, and
- impact the display or output of algorithm-calculated values.

The list of valid DQI codes is in [Appendix A, Table 9](#). A discussion of how DQI codes are used during retrieval of output is in [Section 3.4](#). Details on how DQI codes affect batch processing are in [Section 3.8](#).

- ❖ For a small amount of result updates
  - DQI codes can always be changed on a result-by-result basis by using the regular QWDATA edit program. See [Section 3.2.1](#) or [Tip Sheet 5.5](#).
- ❖ For larger-scale result updates
  - Frequently, a large data set for a project or a water year will be approved at once. Updating DQI codes for large data sets is usually done by the database administrator, water-quality specialist, or an experienced project chief.
  - It is best to begin with a file of record numbers, although this is not required, because the program will accept input to the screen. See [Tip Sheet 5.15](#), then, from the main QWDATA menu, select Option 7—Utilities.
  - From the Utilities menu, select Option 6—Set Data Quality-Indicator (DQI) Code.
  - Indicate your source of identifying records (from a file or the screen), or you may identify samples for a list of agency codes and station IDs ([Section 2.4.2–2.4.3](#)) for a range of dates.
- ❖ You can select to change DQI codes for all parameters and method codes in the samples or for only specified parameters and methods. Input specific parameter-method pairs from the screen or a file (file format is given in [Appendix G](#).)

- ❖ There are eight options for remapping DQI codes, including a user-specified option. The typical records approval is Option 1, where data change from DQI=S, presumed satisfactory, to DQI=R, reviewed. A report will be generated listing the remapping of DQI codes that will occur. You are given an opportunity to review the report before the changes are made in QWDATA. You may want to review this report in another UNIX window, so you can return to the same place in the DQI application.
- ❖ Finally, the application will ask if you want to update the results. If you approve the remapping after your report review, answering “Y” to the prompt will update the DQI codes for all of the data that you specified.

## 5.21 Tip Sheet: How do I rapidly determine discharge for surface-water quality samples?

Water discharge is an important measurement to include with surface-water quality sampling results, and it is normally included as one of the parameters in water-quality data publications. Water discharge at the time of sampling can be obtained from time-series records at surface-water data-collection sites equipped with an automated gage-height recorder. The QWDATA system includes a program for selecting the appropriate discharge for water-quality sampling events from the time series of instantaneous or daily-discharge values. The program may be started by using Option 8 of the QWDATA Applications menu or noninteractively from the UNIX command line, with syntax shown below (options enclosed in brackets).

```
qwdischarge [--database NWISZZ] [--db_no num] [--record_file filename]
[--output_file filename] [--output_format rdb or print_ready] [--help]
```

The interactive menu method is suitable for a small number of computations. See [Section 3.5.8](#) for the menu option behavior. Otherwise, use the command line noninteractively, for example:

```
qwdischarge -db_no 01 -record_file qwrec -output_file q.rdb -output_format
rdb &
```

A file containing the record numbers of the samples needing discharges is required (“qwrec” in the example). Record numbers are listed one per line, optionally concatenated with a database number. If a record number that does not exist in the database is specified, the program will print a message like the one below, and continue to process subsequent record numbers.

```
Entry on line 2052 does not exist: 01002379
```

Many projects will have a record-number file for the relevant samples. Users performing an end-of-year compilation of data may need to assemble a list of potential record numbers. The SQL query below shows how to obtain the record numbers of all samples collected since September 30, 2009, at sites with the capability to store a discharge time series (aka a “data descriptor” record, see the [ADAPS manual, section 3.2.3](#)).

```
tsql nwishq -Gnwis_select "select distinct record_no from QW_SAMPLE_01 a,
SITEFILE_01 b, LOC_01 c, DD_01 d where a.sample_start_dt > '30-sep-2009' and
a.agency_cd = b.agency_cd and a.site_no = b.site_no and b.site_id = c.site_id
and c.loc_id = d.loc_id and d.parm_cd = '00060'" >qwrec
```

For each sample (record number) specified, the program will attempt to look up the most appropriate discharge value from the time-series records. Initially, the program will attempt to find an unremarked instantaneous discharge value for the site that is closest in time to the water-quality sample. The program will search no further than 30 minutes of the sample collection time. Failing to find an appropriate instantaneous discharge, the program will search for a mean daily discharge. A number of circumstances may occur that cause the program to not find an appropriate discharge for a sample. Examples of this are listed on the following page.

- ❖ Discharge is not provided for composite samples (sample-end date is specified).
- ❖ No discharge is determined if no “primary data descriptor” has been defined in ADAPS.
- ❖ Instantaneous discharge is not determined for samples precise only to the day, and no discharge is provided if sample-date precision is less than day-of-month.
- ❖ If the daily mean discharge remark code is “1” or “e” (write protected or estimated), then the daily mean is reported, because the instantaneous discharges may be inaccurate.
- ❖ If the instantaneous discharge remark code is nonblank, and the daily mean discharge remark code is blank, then the daily mean is provided.
- ❖ If no instantaneous discharge is possible, and the daily mean discharge is remarked with “2,” “E,” “&,” “>,” or “<,” then no discharge is determined.
- ❖ A warning message is printed if the daily mean discharge was computed in a different time datum than the water-quality sample.
- ❖ Neither sample medium nor site type is used to control discharge determinations.

If a tab-delimited RDB file is output, the following columns are presented (**--output\_format** **rdb**).

| Column name/header | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| record_no          | Sample record number (eight digits). Database number (two digits) is appended in RDB format or shown as a separate column in print format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| agency_cd          | Agency code associated with the site (five characters). Not shown in print format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| site_no            | Site-identification number (15 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| sample_start_dttm  | Beginning date-time associated with the sample (12 characters). In print format, the end date and time of a composite sample are shown on the line below.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| sample_start_tz_cd | Time datum associated with the sample (six characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| medium_cd          | Medium code associated with the sample (three characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| error_cd           | Any or none of the following messages may be presented. <ul style="list-style-type: none"> <li>❖ Failed. DV not present, No UV present for this sample within 30 minutes</li> <li>❖ Failed. Due to Remark, Daily Value is of questionable quality. Inspect manually</li> <li>❖ Failed. End date is populated (implies Composed Sample); cannot find an appropriate discharge value</li> <li>❖ Failed. Imprecise Sample time: DV missing day of month, or UV missing time</li> <li>❖ Warning. 2 UVs present at an equal time-interval from sample</li> <li>❖ No Primary DD present for this station</li> </ul> |

| Column name/header   | Description                                                                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | ❖ WARNING: Daily value was computed for the day in XXXX.                                                                                                                                                                                                              |
| discharge_dt         | Date of recommended discharge (eight characters).                                                                                                                                                                                                                     |
| discharge_tm         | Time of the recommended discharge (six characters).                                                                                                                                                                                                                   |
| discharge_tz_cd      | Time datum of the recommended discharge (six characters).                                                                                                                                                                                                             |
| data_aging_cd        | Data-aging code of the recommended discharge (two characters).                                                                                                                                                                                                        |
| value                | The recommended discharge value for the sample (cubic feet per second).                                                                                                                                                                                               |
| remark_cd            | The remark code of the recommended discharge (two characters).                                                                                                                                                                                                        |
| suggest_parameter_cd | The recommended QW parameter code for the discharge (five characters). If an instantaneous value is selected, then the suggested parameter code will be “00061,” otherwise parameter code “00060” will be suggested for a daily discharge value.                      |
| suggest_remark_cd    | The recommended QW remark code for the discharge (one char). If a daily discharge is suggested, and that daily discharge is remarked as “Estimated,” then a QW remark code of “E” (estimated) is suggested.                                                           |
| suggest_dqi_cd       | The recommended QW data-quality indicator code for the discharge (one character). If the discharge data-aging status is approved (“A”), then the suggested DQI code is “R” (reviewed and approved). Otherwise, the suggested DQI code is “S” (presumed satisfactory). |

Similar information is presented in a landscape-oriented print-format file (**--output\_format print\_ready**). Processing time generally exceeds 1-discharge determination per second.
